To whom it may concern

The gas isn't going anywhere.
It will always be there and there will always be a demand.
Currently it requires 2-3 million litres of potable water per site.
On top of that 1% is "additives".
Chemical additives that prevent corrosion are not potable.
You then lose 10-30% of the gas during the process.
Find away to use non potable or recycled water. (grey water).
Do not use anti corrosion additives.
Capture 100% of the gas releasing non into the environment around the sights.
Then go for your life.
Until then don't.
Simple really.

Thank you

Thomas Lynch
