The Department noted that a sediment laden discharge had taken place on site and was overtopping the controls. I immediately notified Gary Bowlen, Chad Eisenman, and Tim Berdar. Mr. Bowlen contacted the contractor who met me on site immediately. The contractor immediately ordered to get straw bales to stake behind the overtopped controls. When Gary arrived he ordered a sediment trap be installed right below the crossover drain.

Well is being drilled currently.
E&S is in place and functioning properly.
Access road is in good condition.

On 4/1/2014, I conducted an inspection of the Atlas Resources DEIDRICH # 3 OG WELL well in Jefferson Township, Fayette County. The inspection was the result of Atlas reporting a brine spill of unknown quantity, some of which went off containment at this site. Atlas reported the spill to me on 3/31/14.
On 4/3/2014, Atlas submitted an Initial Spill/Incident Notification to the Department.
According to reports from Atlas, the spill was thought to be the result of a leaking 3" valve and a hole in the 100 barrel tank. The brine leaked out of the tank and caused a puddle of brine inside secondary containment. The containment dike had a drain pipe with a cap. Recent precipitation events caused the fluid in the dike to overflow it's banks. A small amount of brine left the site onto the access road and killed a small amount of vegetation below the road. The area of dead vegetation was approximately 2 foot by 2 foot. The leaking tank will be replaced by a poly tank and the operator has cleaned up the affected soil and performed testing to ensure all

On 8/19/2014, Atlas representative Kirk Elkin called (and left a message) to notify me that that excessive rainfall on 8/12/2014 has caused E&S controls to be overwhelmed and the fill slope to collapse. After receiving an anonymous complaint I responded to the well pad on 8/21/2014. Brian Shpakoff (Atlas) was onsite meeting with Hawbaker to develop a plan to address the slips on the fill slope. I talked to Brian Shpakoff and walked the site. The vegetated swale along the access road was filled completely with fill from the pad. The pad was slumped across the access road to a limited extent. After over a week the ditches and silt sock are completely inundated with rock and fill and have not been maintained in any fashion.
Violations Noted.

Admin review of ESX09-063-0010 (Day Unit 4).

Once earth disturbance activities have ceased and final stabilization has been achieved, a Notice of Termination (NOT) form is to be completed and filed with the Department. The NOT is a regulatory requirement, as well as a permit condition under the letter requirement of condition 23 of the ESCGP-1.

This permit expired on 1/24/2015. To date, the Notice of Termination has not been received by the Department.

Violations are being issued for failure to comply with permit conditions by failing to submit a Notice of Termination.

Inspection was a follow-up to a spill/discharge notification sent to the Department by the operator outlining a release of approximately 15 barrels (630 gallons) of produced fluids. During flooding of Redstone Creek near its confluence with the Monoq
At time of inspection, well drilled and appears equipped for production.According to records, drilling occurred 5/09/2006-5/18/2006.Two well tags installed on wellhead.Dept recommends Opr ensures all tags and/or labels are consistent and accurate.Located within ag field.Shared access road gated.No accelerated E&S issues noted.The discharge line appears to be connected from the well to the separator to the brine tank during this inspection.Brine tank located within vegetative dike. Brine tank is exhibiting severe corrosion, compromising the structural integrity of this tank. Tank has numerous holes located around tank with the lowest hole observed approximately four feet from the ground. Several of these holes are greater than one inch in size.Dept is unable to determine content levels within tank. No active leak(s) and/or discharge(s) observed at this time.Dept recommends Opr implement Spill Policy for any releases that may have occurred.

Violations are being issued under 25 PA CODE 78.54.

Additional comments on paper SAIR*
At time of inspection, well drilled and appears equipped for production.According to records, drilling occurred 12/29/2005-1/03/2006.Well tag present, legible.Access road gated.Located within pasture.Fence located around well site compromised.The discharge line appears to be connected from the well to the separator to the brine tank during this inspection.Brine tank located within earthen dike.Brine tank is exhibiting severe corrosion, compromising the structural integrity of this tank.Tank has numerous holes located around tank with the lowest hole observed approximately at mid-level on the tank.Some of these holes are several inches in size.Content levels within tank appear to be minimal at most.No active leak(s) and/or discharge(s) observed at this time.Dept recommends the Opr implement the Dept’s Policy for Addressing Spills and Releases at Oil & Gas Well Sites or Access Roads (DOCUMENT NUMBER: 800-5000-001) for any spills and/or releases that may have occurred.

Viols are being issued under 25 PA CODE 78.54.

At time of inspection, well drilled and appears equipped for production.According to records, drilling occurred 07/17/2006-07/25/2006.Shared AR gated.Located within ag field.Due to current snow-cover, Dept is unable to adequately assess the site for any potential surface impacts (i.e. E&S concerns, evidence of prior releases, etc).The discharge line appears to be connected from the well to the separator to the brine tank during this inspection.Brine tank located within earthen dike.Brine tank is exhibiting severe corrosion, compromising the structural integrity of this tank.Tank has numerous holes with the lowest hole observed approx three feet from the ground. A few of these holes are approx 0.5 inch in size.Content levels within tank appear to be minimal at most.No active leak(s) and/or discharge(s) observed at this time.Dept recommends Opr implement Spill Policy for any releases that may have occurred.

Viols being issued under 78.54.

Add'l comments on paper SAIR

On 05/20/15 at approximately 1100 hours I responded to a spill at the Atlas Sabatine #5 well. The spill was estimated by Atlas to be approximately 14 barrels based on previous fluid production levels. The spill was caused by an unknown party shooting a projectile into the 50 barrel polytank. The tank was within an earthen dyke. There was approximately 1' of gravel over the soil within the dyke. Some of the gravel had been shoveled to the side so that soil probing could be done. This soil appeared to be damp, but there was no visible fluid at the time of inspection. Lisa RAFFLE of Atlas was present at the time of inspection. RAFFLE used a soil probe to test the soil around the tank. Readings varied from comparable to background upslope of the tank within the dyke to higher than the probe was capable of reading. It appeared that the spill was primarily toward the front of the dyke toward the access road. A contractor for Atlas was also present during the time of inspection to estimate the amount of soil that would need to be removed.

Admin review of ESX10-063-0002 (Manor Real Estate & Coal).

Once earth disturbance activities have ceased and final stabilization has been achieved, a Notice of Termination (NOT) form is to be completed and filed with the Department. The NOT is a regulatory requirement, as well as a standard permit condition of the ESCGP-1.

This permit was issued on 5/10/2010 and expired on 5/09/2015. To date, a request for termination of the permit has not been received by the Department.

On 08/24/15 at approximately 0805 hours a spill occurred at the Yasenosky #4 well site. A release of an estimated 3 barrels of produced water was released from a hole in one of the 210 barrel tanks on site. This discharge was to an earthen berm that surrounds the brine tanks. This is a violation of SWMA 301.

On 09/03/15 at approximately 0800 hours I inspected the site while remediation activities were taking place. Excavation took place at the site during the time of my inspection. I was informed that Atlas was entering into Act 2 under the alternative remediation option.

Well has been plugged.

Deviated conventional oil well in the process of being fraced at the time of inspection. The operator was circulating frac fluid into a temporary lined pit and then pumping it into a frac tank for re-use. Apparently, due to a pump failure of operator error,
Deviated conventional oil well in the process of being fraced at the time of inspection. The operator was circulating frac fluid into a temporary lined pit and then pumping it into a frac tank for re-use. Apparently, due to a pump failure of operator error,

This inspection is a follow-up to a ERT incident (CID# 309449) that occurred on 1/1/2015. At that time, department emergency response personnel were dispached to the site because of a ruptured oil line that caused a spill at that location. At that time the bulk of the spill had covered an area approximately 15x15 yards with a light mist covering an area approximately 30 x 30 yds.

At the time of this inspection it appeared that the oil had been cleaned up and the pipeline repaired. The operator was in the process of pressure testing the line at the time of inspection to determine the integrety of the line.The oil and contaminated soil was not on site. The operator was cited for the spill incident at this time

This inspection was initiated by a complaint related to a strong odor near this well (CID# 323808). The complaint was assigned to our Oil and Gas Inspector. Upon his inspection he found a small spill and refered it to me.
It appeared that the operator was servicing the well causing a discharge of approximately 10 gallons of crude oil on to the ground. The spill apparently occurred on 11/25/16 however the operator had failed to report it. Upon inspection I saw an area approximately 20ft. x 10ft of oil soaked soil covered with absorbant peat. The estimated quantity was 10-15 gallons. I returned about an hour later and the operator had scraped up the peat and soil into several plastic bags for disposal and mulched the disturbed area. The violations were corrected.

Failer to prevent accelerated erosion on the site.

Conventional oil well in the process of being drilled at the time of inspection. There was no drilling permit posted, however the operator did post the permit when informed of the violation. The driller had just completed drilling operations at the time of inspection. The location was frozen and snow covered. The failure to post the drilling permit was immediately corrected. No additional violations noted.

Permit expired. Site prepared and not restored.

well not equipped - abandoned/no tag/inadeq freeboard/site not restored/no well record

On January 20, 2010, I conducted a routine inspection at the site to see if E&S control measures were installed. The E&S BMPs that were installed entailed staked hay bales that were not entrenched into the ground as called for in the DEP¿s Erosi

On 02/02/16 at approximately 1400 hours I conducted a routine complete inspection of the Coastal Smith Unit. The Act 9 sign was in place and all required documents were present at the site.

The flowback pit on site was approved by Department staff to be filled using fill from the site. A gravel pad was then constructed in the location of the filled pit without Department approval. This is a violation of 102.5(m)(4) for failure to perform work to the specifications of the ESCGP.

On 12/21/16 at approximately 1100 hours I conducted a routine complete inspection of the Whyel unit. The Act 9 sign was in place and all required documents were present. A gravel pad and road to the pad was constructed in the location of the Department approved flow back impoundment (see photographs). The location was to be restored to approximate original grade and was to be vegetated. This is a violation of 102.5(m)(4).

No site ID/plan seen E &s controls consist of a rough grade to two well sites, some gravel at egress, and some well development. These sites need attention.

Site constructed, E&S controls not maintained.

Well is drilled, but not equipped for production. Pit is still on-site. Several Violations were noted-

The violations include a freeboard violation, a violation for allowing industrial waste into the waters of the commonwealth, a violation for knowingly pumping waste water from a pit into waters of the commonwealth, and a violation for allowing sediment into the waters of the commonwealth by not properly implementing BMP's.

At time of inspection I the rig GDS-11 and a rig from Ziegenfuss Drilling was on site. According to the Company Man on location, GDS-11 was being used to set conductor for Hoover 1V and Ziegenfuss was setting conductor for Hoover 2H. I asked the Company Man if he had the permits on site for each of the wells being drilled. At the time of inspection, the permit for Hoover 2H was not on Site. The Company Man immediately called Cabot and arranged to get a copy of the permit for the well to be delivered to the Site.
My inspection revealed drilling was occurring without a permit on site. This is a violation of 25 PA Code 78.12 which states "A copy of the permit shall be kept at the well site during drilling or altering of a well".
A copy of the permit was obtained and immediately brought to the site. The violation was corrected and therefore no outstanding violatons exist on this site at this time.
O'Donnell - Dimock Twp, 9/1/09 insp of Segment 10 of Cabot O&G Pipeline Zone 1, E58-280, 1st spill of bentonite clay drilling mud contained w/sediment barrier & hay bales yet drill mud came to surface immediately adjacent to delineated wetland
O'Donnell - Dimock Twp, 9/4/09 insp of Segment 10 of Cabot O&G Pipeline Zone 1, E58-280, 2nd spill of approx 200 gal bentonite clay drilling mud emerged to surface of the ground and entered unamed tributary to Stevens Creek, viol of CSL 691.
Follow up on drilling mud seeping out of ground downslope of the wellpad.
CSL 401 black fluid discharge to surface and waters in area of Hibbard 2H & 4H well pad, 78.56(a)(1) tears in liner.
CSL 401 black fluid discharge to surface and waters in area of Hibbard 2H & 4H well pad, 78.56(a)(1) tears in liner.

appearance of drilling residuals on the surface of the well pad during the 9-21-11 inspection reports. The outstanding violation of Pollution prevention measure, Section 402 Clean Streams Law can be referenced in the 9-1-11, 9-2-11, 9-21-11, 10-5-11 and 10-6-11 inspections reports. The new violations observed during the inspection are, Section 25 Pa. Code §78.56(a) and section 301 of the PA Solid Waste Management Act, 35 P.S. §6018.301, due to the compromised liner intergrity observed during the excavation of the test pits and the drilling residuals contacting the surface of the ground.

Dark staining and drilling residuals were observed to be contacting the surface of the ground throughout the pit and the excavation process along with compromised liner integrity. The earthen wall of the south section of the pit in the northwest corne
Dark staining and drilling residuals were observed to be contacting the surface of the ground throughout the pit and the excavation process along with compromised liner integrity. The earthen wall of the south section of the pit in the northwest corne
A new violation was noted during the inspection. The Department has been able to determine that the waste material in the pit was not encapsulated within the liner in accordance with 25 PA code § 78.62(a) based on the extent of the excavation. Section 25 PA code § 78.62(a)15) states "The liner shall be folded over, or an additional liner shall be added, to completely cover the waste and the waste is shaped so that water does not infiltrate the liner and is not confined above the liner". Departed from the site at 11:30 AM.

A new violation was noted during the inspection. The Department has been able to determine that the waste material in the pit was not encapsulated within the liner in accordance with 25 PA code § 78.62(a) based on the extent of the excavation. Section 25 PA code § 78.62(a)15) states "The liner shall be folded over, or an additional liner shall be added, to completely cover the waste and the waste is shaped so that water does not infiltrate the liner and is not confined above the liner". Departed from the site at 11:30 AM.

Mr. Mehalko informed me in a phone conversation that sampling results revealed high levels of strontium in a section of the pit. Cabot will proceed to the remove pit material in this particualr area in the near future. A date has not been set as of yet for this event to occur. He also informed me that currently a liner is in place in the pit to prevent water from precipation events entering the pit and making contact with the surface of the ground. Upon removal of the pit material where the elevated strontium levels were detected from the sampling results, URS will perform another sampling event in attempt to achieve passing results. If passing sampling results are established, the pit liner will be removed and the pit will be backfilled with clean fill material stockpiled on the northeast corner of the well pad.

H&P 371. Currently drilling @ depth of 9150'. Drillers log on site and up to date. Secondary containment in place. Followed up on 3 reported spills of drilling mud. 2 spills due to mechanical failures. Both spills on plastic. 3rd spill located behind m

Arrived at the site at 11:20 AM in response to a production fluid spill that was discovered by a GDS associate on February 8, 2012 at 13:25 PM at the Fraser Tank Pad. The quantity of production fluid spilled was determined to be approximately 20
Arrived at the site at 11:20 AM in response to a production fluid spill that was discovered by a GDS associate on February 8, 2012 at 13:25 PM at the Fraser Tank Pad. The quantity of production fluid spilled was determined to be approximately 20

Arrived at site at 12:20 in response to release of (4) to (6) barrels (bbls) of synthetic oil- based mud (SOBM) that occurred between 6:00 and 6:30 AM on 4-19-12. Pattesron-Uti Rig # 538 is active drilling rig at the site. Current drilling depth is 5,352 feet. Mr. Webster reported release at 8:40 AM to the Department. Report indicated that (21) gallons of SOBM escaped containment & impacted surface of ground on Well Pad. The result of release was due to night shift derrick hand attempting to shut butterfly valve on tank labeled #4 and then opened the suction and discharge valves of tank labeled #5. He began circulating the tank and was relieved. The centrifugal pump was engaged and was pulling SOBM out of both tank #4 and tank #5 and circulating back into tank #5.

*On the eastern side of the well pad (fill slope), the E&S Plan map shows one row of filter sock however two rows of filter sock have been installed in the field and a slope interrupter.
*The rock outlet for the diversion channel on the north side of the well pad is beginning to cause rills to form downslope, heading east. *The perimeter berm on the well site has not been temporarily stabilized. *The cut slope appears to be properly tracked and hydroseeded except for an area in the southeastern side of the slope where rock was encountered.
*Areas have not been temporarily stabilized. *Tension cracks and sloughing were noted. *The rock construction entrance does not meet plan specifications

Areas downslope of FS#8, which should be left undisturbed, have been cleared.
Waste has been noted along the north and northwestern areas of the topsoil stockpile.
Cabot estimated that an approximate 1 bbl. of a synthetic oil based drilling mud was released between the two points. The impacted areas were excavated on 6/9/2012. The excavation around the loose fitting was approximately 7' x 4' x 1' and the e
released was determined to be (22,000) gallons. The report indicates that the release occurred due to a corroded valve on manifolded tanks and Cabot initiated immediate response and clean-up of the incident in excess of (22,000) gallons recovered which consists of rainwater and shallow groundwater collected with the released fluid. Interceptor trenches were dug down gradient of the fill slope of the Pad in the north section of the site to further collect material. During the inspection, Cabot indicated to the Department over (500) barrels of flowback fluid were released and they have removed (40,000) gallons of a mixture of the flowback fluid released with rainwater and shallow groundwater from the site. The location were the fluid has been removed thus far is the Pad, test pits and trenches.

released was determined to be (22,000) gallons. (Consultant) who explained that containment had been installed on well site on 3/28/14. At this time, the Dept discovered sheen on several areas of the well site. Also noted was what appeared to be hydraulic fuel in a puddle on the well site. The Dept requested that the operator immediately resolve this issue. The operator explained that they would have a vacuum truck remove the standing water on the well site. Based on OGI Graby's 3/27/14 insp, it was determined that a pollutional substance had impacted the surface of the ground at the well site. Staining was clearly visible around the well head which is a violation. The Dept requests that the operator make a notification when they will be removing the containment so that the Dept may conduct an inspection.

The inspection revealed that approximately 50% of the tank pad cut slope is not temporarily stabilized. The original erosion control blanket has degraded to the point that it no longer qualifies as an approved control. It appears as if an attempt had been made to hydro-seed the slope, but failed. The slope shows signs of having minor slope failures. A review of Department records revealed that in December of 2011, a Department representative had issued an NOV for this same slope because of similar conditions.

The record review also revealed that the Zupp, K. 1 Well had a drilling completion date of 4/2/12, and a stimulation completion date of 5/19/12. The Zupp, K. 2 Well DOW permit expired on 2/3/13. Based on the dates listed above, well site

The slope shows signs of having minor slope failures. A review of Department records revealed that in December of 2011, a Department representative had issued an NOV for this same slope because of similar conditions.

The record review also revealed that the Zupp, K. 1 Well had a drilling completion date of 4/2/12, and a stimulation completion date of 5/19/12. The Zupp, K. 2 Well DOW permit expired on 2/3/13. Based on the dates listed above, well site

On 6/24/14, Cabot Oil and Gas reported a 20 gallon release of hydraulic fluid to the ground due to the failure of a master cylinder of a dump truck. Cabot emailed an electronic copy of their remediation summary report for this spill. Attached is a cop

Mr. Peterson explained that on 10/21/14 at approximately 1400 hours, there was a three (3) truck convoy of drill pipe making its way up the access road. The 1st truck (License Plate PT1470Y) stopped ½ of the way up the road, when the release was noticed, and then they drove it to the top and parked it on containment. The 2nd truck stopped and it was determined by the operator that the release was contained to the back of the truck and no impact was noted on the access road.The release was an approximate 10 gallons of MI Swaco Mud (Synthetic oil based drilling mud). GDS took a grader, who was stationed on site, and scrape within an hour of discovery. The impacted material and waste product was staged on site within a 50 yard dumpster. The release was not believed to be sampled yet. Currently the pipe is staged on site with containment laid beneath it on both ends. The operator reported that being that it is laying flat, it is no longer leaking.
Andy Mehalko of Cabot Oil and Gas reported the spill incident to the department on 10/30/2014 at 5PM. Mr. Mehalko reported to the Department that a truck driver reported to Cabot that he forgot to disconnect the hose from a frac tank and the hos

The area had been vac'd by Somerset and the area had been scraped but additional material had to be removed. Resource will be taking samples of the area to confirm cleanup, and a systematic random sampling grad will be set up to ensure cleanup of area.

Department sampling of the containment produced readings of OR (Over Range >20ms/cm) on the ExTech ExStik II conductivity meter. This material had not been vac'd up as of the time of inspection.

The spill will be going to Act II.

oil along the access road for approximately 700 feet, in about a 1 foot swath. Immediately upon noticing the spill, the affected material was scraped up and disposed into a rolloff container, filling it about halfway. Resource sampled the area, in 16 locations along the access road and had a high reading of 5.4 ppm. At 1030 hours on February 24, 2015, the Department met with Steve Watson of Cabot to investigate the matter. Upon arriving at the scene, it was noted that the area was indeed scraped clean, and the only residual staining was directly under the grader which was being repaired, with that area to be cleaned up immediately upon repair.

There were violations which were immediately corrected.

If there are any questions please feel free to contact me at (570)346-5539.

Failure to obtain approved WMP for wells 115-21734, 21733, 21363, 21650 & 21651 - Admin inspection for purpose of creating NOV record (Enf 321013)

NERO EC&B granted Act 2 ROL 9/9/15. Self-report of a release of production fluid. It was reported that an estimated 10 gallons of production fluid were released to the well pad surface on 5/7/15. A slug/burp of production fluid exited the hatch on the top of a production fluid tank in the form of a mist as a Cabot well tender was in the process of performing maintenance on the Grosvenor 1H well. The well tender was adding soap sticks into the well to decease the hydrostatic pressure of the water in the well.

The cause of the release is being attributed to a "T" in the pipe inside of the production fluid tank.. This caused the fluid to release out of the top of the tank and for it to impact the ground surface of the well pad. Mr. Webster was unable to verify which tank had the issue. Visual staining from the release was cleaned up the same day that it had occurred. It was reported that most areas were excavated between 1"-2" but some areas may be 6"-8" deep. It was estimated that roughly 40 yards of impacted material were removed.

On 4/8/2016, the Department conducted a follow-up inspection of a release of 25 gallons of blended fluid at the Cabot Stellitano A. Well Pad located in Gibson Township, Susquehanna County. Present during the inspection were myself, Jon Sassi,

Steve Watson, Environmental Health and Safety Specialist of Cabot Oil and Gas, contacted me at 8:36 AM on 7/22/16 to report a spill of (200) gallons of a mixture of recycled water and freshwater on the well pad off containment. Mr. Watson stated the following information. “The spill occurred in the Southeast corner of the well pad. Keane was in the process of fracking the 3H well when the spill occurred. A mixture of (25%) recycled water and (75%) freshwater overtopped a (55) gallon drum as part of an air vent tied to a transfer line. The line runs from the tank pad to the well pad. A blue disc made of plastic got sucked up into the fluid hose inside the drum. The disc got stuck above the ball valve in the air vent valve as water was flowing in the transfer line. This caused the water to flow into the hose and out of an opening on the top of the drum, onto the ground. The water flowed out of the drum and onto the ground for 4 or 5 minutes until it was discovered around 7AM. The valve on the air vent was shut immediately upon discovery of the spill. A backhoe and a roll-off container are there now. There is standing water on the pad. Resource Environmental is on their way. They will screen the area on the well where the spill occurred for conductivity and collect samples. The recycled water is brought to the site from Comtech. The fresh water is brought to the site from water withdrawals. Cabot will seek Act 2 Relief of Liability."

I arrived at the site at 11:45 hours to investigate the incident and conduct an inspection of the site. I met with Mr. Watson on the tank pad of the site as I arrived. I also met with Andy Rodriguez, site Company Man, completions consultant of Cabot, Tony Maury, Account Manager of Rain for Rent, Steve Catalfamo and John Corbin of Resource. Cabot submitted a stimulation notice to the Department on 7/13/16 indicating that stimulation of the 3H well would commence on 7/18/16 at 7AM. Keane is currently in the process of conducting hydraulic fracturing operations on the H Petersen 3H well. The 12th stage was completed as of 7:25 AM, with this stage commencing at 5:15 AM according to Mr. Maury. Mr. Maury further stated that Cabot is in between frac stages and not currently pushing water through the transfer line and into the well. The impacted area where the spill occurred in the SE corner of the pad is next to the well pad perimeter berm at the top of the fill slope. A backhoe is being used to remediate the impacted area. A Diaz roll-off container covered with a liner made of plastic material is staged next to the backhoe. Mr. Watson informed me that the remediation process commenced sometime between 10:45-11:00 on 7/22/16. Thus far, (1) container of impacted material has been filled. The container is staged on the tank pad awaiting disposal via rail to Tunnel Hill Reclamation Landfill in Ohio. Resource is currently in the process of performing soil conductivity screening in the impacted area. The intent of the screening is to determine the extent of the excavation. Resource recorded (35) milliSiemens/cm³ conductivity in pooled fluid, and conductivity in the range of (300-1,000)
Steve Watson, Environmental Health and Safety Specialist of Cabot Oil and Gas, contacted me at 8:36 AM on 7/22/16 to report a spill of (200) gallons of a mixture of recycled water and freshwater on the well pad off containment. Resource recorded (35) milliSiemens/cm³ conductivity in pooled fluid, and conductivity in the range of (300-1,000)
Frank Hoehle, DEP O&G WQS, and I arrived at the site at 10:45 to investigate the discovery of an additional area of the tank pad surface impacted due to a release. The Department conducted a Routine Complete Inspection of the site on 6/27/16. During that inspection, the Department discovered an area of staining white in color, and crystallization in the Northeast corner of the tank pad where a tank farm was located. The Department poured organic free reagent water on the dry surface in order to obtain conductivity readings in this particular area. A Hanna HI 98331 Soil Test EC & Temp meter was used to record conductivity readings. The readings were in the range of (600-720) microSiemens/cm³. The tank farm consisted of frac tanks staged on secondary containment. Mr. Watson contacted the Department on 7/27/16 upon receipt of the Department's 6/27/16 inspection report. He stated the following. "Cabot has identified a spill of flowback or recycled water to the tank pad surface on 7/27/16 where the staining was discovered on 6/27/16. Resource Environmental is currently at the site conducting soil electrical conductivity screening in attempt to delineate the extent of the release area. The soil conductivity readings were in the range of (200-1,965) microSiemens/cm. The area impacted is 40' X 40'. Surficial scraping has been done thus far by digging w/ shovels. The amount of fluid released and the release date is unknown. We will collect samples and dig a few inches deeper if we continue to find elevated conductivity readings." On 8/17/16 the Department engaged in a phone conversation with Mr. Watson in reference to this release. Mr. Watson stated the following. "We do not know what was released or the volume as of yet. We have collected samples, but do not have results. We will contact Oil & Gas with the results when they are available. Our consultant discovered another area that they believe has been impacted as well. They have excavated and approximate 40’X40’ area and sent 15 cubic yards of material to Tunnel Hill Landfill thus far. We are going to go through Act 2." Mr. Watson accompanied the Department during the 8/23/16 inspection. There was no activity at the site during the inspection. All wells listed below in the inspection report are in production. There is some standing water accumulated on the tank pad surface due to the recent rainfall event. Orange flags are set in place as boundary markers for the impacted and remediated area in the NE corner of the tank pad next to the fill slope and the most recently discovered impacted area south-southwest of the first impacted area discovered. There are (3) Diaz roll-off containers on-site, with (2) of the containers sealed and (1) is open. Mr. Watson provided the Department a site map prepared by Resource Environmental of Montrose, PA. Excavation A as indicated in the map is in the NE corner of the tank pad. The area of the tank pad surface remediated in excavation A is (1,865.5) square feet, with the range of depth of this excavation (3"-10") according to the site map. Excavation B as indicated in the map is closer to the center of the tank pad. The area of the tank pad surface remediated in excavation B is (259) square feet, with the range of depth of this excavation (8"-12").

Frank Hoehle, DEP O&G WQS, and I arrived at the site at 10:45 to investigate the discovery of an additional area of the tank pad surface impacted due to a release. The Department conducted a Routine Complete Inspection of the site on 6/27/16. During that inspection, the Department discovered an area of staining white in color, and crystallization in the Northeast corner of the tank pad where a tank farm was located. The Department poured organic free reagent water on the dry surface in order to obtain conductivity readings in this particular area. A Hanna HI 98331 Soil Test EC & Temp meter was used to record conductivity readings. The readings were in the range of (600-720) microSiemens/cm³. The tank farm consisted of frac tanks staged on secondary containment. Mr. Watson contacted the Department on 7/27/16 upon receipt of the Department's 6/27/16 inspection report. He stated the following. "Cabot has identified a spill of flowback or recycled water to the tank pad surface on 7/27/16 where the staining was discovered on 6/27/16. Resource Environmental is currently at the site conducting soil electrical conductivity screening in attempt to delineate the extent of the release area. The soil conductivity readings were in the range of (200-1,965) microSiemens/cm. The area impacted is 40' X 40'. Surficial scraping has been done thus far by digging w/ shovels. The amount of fluid released and the release date is unknown. We will collect samples and dig a few inches deeper if we continue to find elevated conductivity readings." On 8/17/16 the Department engaged in a phone conversation with Mr. Watson in reference to this release. Mr. Watson stated the following. "We do not know what was released or the volume as of yet. We have collected samples, but do not have results. We will contact Oil & Gas with the results when they are available. Our consultant discovered another area that they believe has been impacted as well. They have excavated and approximate 40'X40' area and sent 15 cubic yards of material to Tunnel Hill Landfill thus far. We are going to go through Act 2." The area of the tank pad surface remediated in excavation B is (259) square feet, with the range of depth of this excavation (8"-12").
Steve Watson, Environmental Health and Safety Specialist of Cabot Oil and Gas contacted me at 10:31 on 11/4/16 to report an estimated spill of (10-15) gallons of hydraulic fluid to the tank pad surface of the R Lambert well site. The complaint details in the Department's complaint inspection form state the following information. "R. Lambert Pad – Hydraulic hose broke on Susquehanna Gas Field Services water truck. 10 to 15 gallons of hydraulic fluid spilled to the tank pad surface. Spill happened at 9:45 AM Nov. 4, 2016. Backhoe on site to clean-up and roll-off container is on its way. The impacted area will be scraped. Resource Environmental will take PID readings." Mr. Watson stated to me during the phone call that hydraulic fracturing is in progress at the site and the roll-off container should be there around 10:45. He also stated that Cabot will not collect samples; the PID readings will be sufficient enough to determine that the spill is properly cleaned up.

I arrived at the site at 12:50 in response to the spill incident. I initially met with Larry Fulmer, Wayne Wilridge and Ken Wilson, completions consultants of Cabot. Keane Frac is the Cabot subcontractor conducting hydraulic fracturing operations. Cabot submitted stimulation notices to the Department on 10/21/16. The notices indicated that frac operations would commence on 10/19/16 at 6:00 AM at the Lambert Pad. Mr. Fulmer stated that zipper frac operations are in progress for the odd number wells 1H, 3H, 5H, 7H, and 9H. Mr. Wilridge and Mr. Wilson explained that a low pressure hydraulic line secured with a clamp blew off on a (120) barrels of water and/or fluid capacity tractor trailer owned by Susquehanna Gas Field Services. There was (110) gallons of hydraulic fluid in the tank prior to the release, with a (101) gallons left after the line blew off, thus (9) gallons was spilled to the ground according to Mr. Wilridge and Mr. Wilson. They further stated that a drum was filled with oil soaks used to contain the spill and peat moss was also placed onto the ground to absorb the fluid.

The hydraulic fluid spill impacted the tank pad surface near a tank farm/frac tank battery containing freshwater and recycled water utilized during stimulation of the wells. The frac tanks containing the water and the fluid are located near where the tank pad and access road meet. A backhoe was being used to remediate the impacted area. Steve Catalfamo of Resource Environmental informed me that initial Photoionization Detector readings were in the range of (12-15) parts per million. These readings were recorded prior to the commencement of the remediation process. As the backhoe dug deeper, PID readings were much lower. Thus far (5) to (6) cubic yards of impacted material has been removed. The excavation and screening will continue until readings are less than (2) ppm. The excavation will be backfilled with clean fill with the impacted material most likely being disposed of at Keystone Landfill. I left the site at 13:45.

Steve Watson, Environmental Health and Safety Specialist of Cabot Oil and Gas contacted me at 10:31 on 11/4/16 to report an estimated spill of (10-15) gallons of hydraulic fluid to the tank pad surface of the R Lambert well site. The complaint details in the Department's complaint inspection form state the following information. "R. Lambert Pad – Hydraulic hose broke on Susquehanna Gas Field Services water truck. 10 to 15 gallons of hydraulic fluid spilled to the tank pad surface. Spill happened at 9:45 AM Nov. 4, 2016. Backhoe on site to clean-up and roll-off container is on its way. The impacted area will be scraped. Resource Environmental will take PID readings." Mr. Watson stated to me during the phone call that hydraulic fracturing is in progress at the site and the roll-off container should be there around 10:45. He also stated that Cabot will not collect samples; the PID readings will be sufficient enough to determine that the spill is properly cleaned up.

I arrived at the site at 12:50 in response to the spill incident. I initially met with Larry Fulmer, Wayne Wilridge and Ken Wilson, completions consultants of Cabot. Thus far (5) to (6) cubic yards of impacted material has been removed. The excavation and screening will continue until readings are less than (2) ppm. The excavation will be backfilled with clean fill with the impacted material most likely being disposed of at Keystone Landfill. I left the site at 13:45.

The Department, Briana Cunningham, DEP O&G WQS and I arrived at the site at 11:30 AM to conduct an investigation of the spill incident.
The Department, Briana Cunningham, DEP O&G WQS and I arrived at the site at 11:30 AM to conduct an investigation of the spill incident. We initially met with Kevin Hagadorn, lead flow hand of Erick Flowback Services Incorporated, the Cabot subcontractor in the process of conducting flowback operations on the Bolcato wells. Mr. Hagadorn stated that flowback of the wells is nearly complete and we are cleaning out sand from the wells. Natural gas is sent directly to sales according to Mr. Hagadorn and there is another crew on-site setting the wells up for production. The Department informed Mr. Hagadorn that they had mobilized to the site in order to investigate the spill incident. Mr. Hagadorn contacted Mr. Watson to inform him that the Department was at the site in preparation to assess the spill incident. Upon completion of our conversation with Mr. Hagadorn, the Department walked to the area on the pad surface where the spill occurred. As we arrived to the area of impact, a GasSearch Drilling Services truck labeled residual waste was in the process of recovering water in the trench. Kevin Young, the GDS truck driver recovering the fluid, stated that thus far (4,068) gallons of water was removed from the trench and that the mixture of rain water and the black substance has been continuously removed from the trench via a vacuum truck since yesterday afternoon. The water in the trench was predominantly clear to light brown in color. At the bottom of the trench, where the suction outlet for the hose was collecting water, the water and rocks were dark gray in color. A hoe was used to excavate a sump at the bottom of the trench to collect the water and to dig into the sidewall of the trench to determine the extent of the contamination. The location of the impact is South-Southeast of the 10H well. Water and soil in a trench dug (4) feet in depth east of the wells and the production sand traps did not reveal any dark staining or black substance. Mr. Lozano arrived at the site at 12:15 PM. He stated that it was not a long period of time after the black substance was discovered in the water in the trench that the fluid turned light brown in color, indicative of the pad material mixing with rainwater; in particular near where the hose is collecting the water and the hoe is located. Mr. Watson arrived at 12:30 PM. He stated the following. "While the production crew was in the process of digging the trench to install natural gas lines, they saw a black substance in water in the trench around 3:30 PM on 11/15/16. Light rain was falling when they saw the substance. As of 7:00 AM this morning, 11/16/16, (3,000) gallons of water have been pumped out of the trench. The water smelled like drilling fluid or diesel based mud. No surface staining has been observed and there were no reported releases when the containment used for drilling was removed. Resource should be here today to collect water samples. The water removed from the trench via the vacuum truck will be placed into a frac tank at the site. Conductivity of the water in the trench was reported to be in the range of (350-1,000) micro Siemens/cm using two separate meters. A portion of the concrete
The Department, Briana Cunningham, DEP O&G WQS and I arrived at the site at 11:30 AM to conduct an investigation of the spill incident.

The water smelled like drilling fluid or diesel based mud. No surface staining has been observed and there were no reported releases when the containment used for drilling was removed. Resource should be here today to collect water samples. The water removed from the trench via the vacuum truck will be placed into a frac tank at the site. Conductivity of the water in the trench was reported to be in the range of (350-1,000) micro Siemens/cm using two separate meters. A portion of the concrete

This administrative inspection has been created to document a production fill spill in the range of (10-20) gallons to the pad surface that occurred on 12-8-16 as documented in the Department's 12-9-16 inspection report. Cabot submitted a Remediation Summary Report prepared by Resource Environmental of Montrose, PA to the Department on 12-15-16. The report contains a site map of the release area and perimeter of excavation, (5) test pit locations dug for soil conductivity screening, conductivity readings measured after the final excavation and a remediation summary report containing a description of the incident, remedial action and waste disposal information. The description of the incident in the report states that the following. The spill of (10-20) gallons occurred on 12-8-16. An unanticipated surge of production fluid flowed through the dump line to the production fluid tanks when a well tender was performing maintenance. The spill impacted the immediate area of the production fluid tanks. The remedial action in the report states the following. Cabot had disassembled and relocated the dump lines and production fluid tanks on 12/9/16 to provide access to the immediate area. GasSearch Drilling Services performed the excavation of the impacted area under the direction of Resource. Resource characterized impacted soil by visual observations and field screening the soils for electrical conductivity. The highest soil conductivity measured by Resource in impacted area with dark staining was (568) micro Siemens/cm³. Where light staining of the impacted area was observed, the soil conductivity readings were less than (60) µs/cm³. Post excavation soil conductivity readings were less than or equal to (59) µs/cm³. The dimensions of the excavation were 50' x 42'. The typical excavation depth was 1 to 3 inches, but was measured at (10) inches where dark staining was observed. Approximately eighteen (18) cubic yards of impacted soils were loaded directly into two (2), lined, 30 cubic yard, roll-off containers for off-site disposal at an approved facility. Cabot has concluded that characterization and post remediation field screenings demonstrate that no additional remediation is related to this release. The Department reviewed the report on 12/16/19 and has concluded that no further action is warranted of Cabot at this time.

Violations immediately corrected are associated with the R Warriner 4H well.

Please forward the waste disposal manifests to the Department upon receipt.

Please feel free to contact me with any questions at 570-346-5533 or jsassi@pa.gov.

John Savage - company man. Nabors Rig M05. Currently at depth 6887'. Landed and now drilling lateral. Proposed TD - 12015'. 13 3/8" set at 680' and had no returns on cement job. Ran bond log to determine TOC. Did top job with 1" tremie and had returns. 9 5/8" set at 1805'. Had 35 bbls returned. BOPs passed.
Observed spill of drilling fluid outside containment near solids handling area. Violation cited.
On site to inspect condition of wells as part of water supply investigation. Well has been drilled to KOP. Intermediate set. On site with Eric Rooney (DEP Geologist). At time of inspection - both valves on top of well open to atmosphere. Audible blc
The Department is issuing a Notice of Violation based on the sample results of ponded water on the surface of the ground on the Well Pad and an incident report submitted by Carrizo to the Department via e-mail on 7/26/12. The sample was collected during the 6-13-12 inspection of the Baker West Well Pad. The sample was collected as a result of an over the limit conductivity reading in the ponded water. Please refer to the Baker West 1H, 6-13-12 inspection report for details. DEP Labs submitted the final results on 8/6/12 of the samples collected by the Department on 6/13/12. The results indicated elevated concentrations of the following parameters.

Specific Conductivity; 135,000.00 umhos/cm;
TDS; 113,302 mg/l;
Chloride; 59,795.00 mg/l;
Strontium; 1,030 mg/l;
Barium; 1,570 mg/l;
Sodium; 25,000 mg/l;
Hardness; 11,852 mg/l;
Bromide; 203.054 mg/l;
Calcium; 4,240 mg/l. Compromised liner integrity was observed in the NW and SW corner of the containment area.

w/fluids.Black staining present on gravel adj to cellar & extends past surrounding cement blocks (also stained black) as evidence of previous overflow.No clean-up efforts appear to have commenced.Well drilled, not yet frac'd.WT present.TD date was 6/8/12.Per current regs, Opr shall restore well site w/in 9 mos of completion of drilling; hence, restoration deadline was 3/8/13.Site not yet restored.Dept unable to locate on-site PPC plan.Dept unable to locate ERP.Dept unable to locate on-site E&S plan.Viols being issued for failure to properly control & dispose of residual fluids, for failure to have an ERP on-site, for failure to have a PPC plan on-site, for failure to restore well site, & for failure to have an E&S plan on-site.Add'l viols may be forthcoming upon review of ESCGP-1 as not located on-site at this time.

The Department, represented by Frank Hoehle and Scott Kuchta, was on site at the Shaskas well pad to conduct a routine complete inspection. The wells associated with this site are as follows:
115-20489
115-20490
115-20491
115-20651
115-20652

The Department inspected the site on April 7 and there was a large failure of the cut slope noticed. (Photo 1) There was no repair of the site ongoing, nor was it noted in Carrizo's E&S Inspection log for the site. The cut slope failure extended >50 feet and was >8 feet throughout its length. A sizable portion of the slope was slumping and unstable. (Photo 2)

While on site it was also noticed that there was sheen readily visible in the containment area near the cut slope (Photo 3), and the containment seemed to be torn and patched poorly (Photo 4), although no sheen was apparent outside the containment area. It is suggested that the fluid on containment be vacuumed up and the containment checked for possible tears.

If there are any issues please feel free to contact me.

At time of inspection, arrived on site at 11:15a.m., the cellar was full of water with no bubbling noticed, the (13x9) annulus was venting into the atmosphere with gas detected at 100% LEL and 19% methane with no measurable flow. The (9x5) vent pipe was open and venting into a tank. I took a walk around the location and there were no obvious concerns noticed.
The well was granted inactive status on 2/25/15.
I left the site at 12:20p.m.

According to the incident report approximately (20) gallons of corrosion inhibitor, primarily composed of methanol as per MSD sheets, impacted the surface of the ground on the Well Pad. The incident occurred as a tote container containing the corrosion inhibitor was being moved away from the wellhead in preparation for wellhead work. A frame had broken on the container during transportation forcing the susbstance to be released on the surface of the ground off containment on the Well Pad. After discovering the ocurrence of the incident, the tote was placed on containment. The spilled material where the release occurred was excavated and placed on containment and covered. SAIC performed sampling analysis of the contaminated soil and excavated area where the release occurred on 3-7-12 and 3-9-12.

Arrived at the site at 12:00 in response to a report of a Chesapeake inspector recording high conductivity levels in puddles of water at the site and to investigate Complaint ID: 294361 (eFacts Inspection ID: 2131827).

The Department received notification from Chesapeake of elevated conductivity levels in the puddles at 18:35 on 1/16/13. The report indicates the water has been vacuumed up, contaminated soils have been placed on containment and that Chesapeake suspects that the water had been contaminated by road salt residue that had been tracked on to the location from vehicles entering the site. We discovered a leak had sprung from the pressurized brine transfer line and a fluid had begun to leak directly on to the surface of the ground on the Well Pad. Mr. Parsons had all fracking activity cease and began to evaluate the leak from the pipe. I used an Extech, ExStik (2) pH, Conductivity, Salinty and TDS meter to field screen the puddle associated with the leak. I recorded an over the limit conductivity reading.

Site under construction. Access rd over 1 mile long, much blasting, HQ and Class A streams,

Pad under construction. Access road over 1 mile, 350 ft elevation, HQ Class A waters, erosion and sequence issues

Spill called in. Approx 2 barrels synthetic drill mud, some got off containment and onto pad. Cleaned up.
Inspection conducted on 4/22/13 of the reclaimed Chesapeake Joyce Road Location. Inspection conducted to confirm Chesapeake's assessment that the reclaimed well pad stabilization meets the requirement necessary to terminate the ESCGP-1 Silt sock has been run over and pushed to the side. Weekly inspection report does not mention need to repair silt sock and confirms that there is less than 70% vegetative cover.
This inspection conducted on 6/6/13 of the CHK Baltzley 3H is in response to Chesapeake's reporting of a spill which occurred at this location on 5/27/13 at 1210 hrs. CHK reported that while conducting stimulation activities of the 3H, 5 barrels of hydraulic fracturing (stimulation) fluid/sand was released to an unlined section of the pad surface. CHK reported that the impacted pad material had been cleaned up and placed on containment.

Inspection conducted with Tim Long, Company Man. Tim explained that his understanding of events was that a wash out had occurred and that the stimulation fluid had sprayed onto an unlined section of the pad located between the stimulation operation containment and the production equipment. Once the spill was identified, a skid steer was utilized to scrap the pad surface and collect the contaminated material. The material was placed on a heavy mil liner, folded over, and is still on site. This containment looks good.

This inspection conducted on 6/6/13 of the CHK Baltzley 3H is in response to Chesapeake's reporting of a spill which occurred at this location on 5/27/13 at 1210 hrs. CHK reported that while conducting stimulation activities of the 3H, 5 barrels of hydraulic fracturing (stimulation) fluid/sand was released to an unlined section of the pad surface. petroleum products. The second spill was located on the west side of the containment. A dark wet area of approximately 50 feet X 20 feet emanated from the containment. Soil in this area did not have a petroleum odor. The corner of the containment just south of the western most Baker tank had been sealed with tape which did not hold and allowed fluids/residual waste to escape the containment. A second area about 15 feet further south also appeared to have a leak. The above issues were discussed with the company man on site, Mr. Frasier. The Department recommends both spill areas be excavated to remove all contaminated soil, containment be replaced/repaired to ensure no leaks to the environment, and measures be taken to ensure the Department receives timely notification of spills

plug leaked and sprayed brine onto containment, Pad discharge (est 25-30 gal) due to containment leak. Cleaning up. Will provide sample results. Pending until that time.

On November 6, 2013, I stopped at Chesapeake's James Herold B pad for a routine inspection. This site has two gas wells associated with it, 8H (059-25922) issued 2/14/12 and 3H (059-25990) issued 5/2/12. The associated ESCGP-1 is ESX11-059-0011.

There was no sign at all identifying the site and I had to ask residents where the site was. Additionally, I found no well permits, E&S plan, PPC plan or any other paperwork on-site.

The site itself is only partially developed. There were perimeter controls (silt sox) and some dirt piles but it was obvious that nothing had been done at this site for months. I saw no evidence that any well was spudded. The access road was rutted and starting to form gullies.

Chesapeake submitted a report to the Department on 11/8/13 in relation to the spill incident that occurred at the site. The report indicates a brine spill of approximately (25) gallons was released to the soil on 9/25/13 while equipment was being mov

Admin review inspection record for NOV issued 1/8/2014 (Forks & Elkland Twps, Sullivan Co GMI - Lambert Farms 2H, 113-20016 & Matt 2H, 20059)
Site was inspected in response to report from operator of a spill of crosslink fluid during stimulation operations. Cleanup operations were ongoing at time of inspection. Contaminated area had been partially excavated and de-contamination area for vehicles struck by spilled fluid was being setup on containment.
Weatherford Fracturing Technologies had a chickson (iron failure) on one of the risers to the wellhead fail while pumping crosslink fluid on 2ppg sand for stage 15 @ 8200 - 8300 psi at approximately 2330 on December 12, 2013. The failed part was rated at 10,000 psi and had recently been inspected.
Pumping rate at time of failure was 65 barrels per minute. It is estimated less than 80 barrels were spilled; 40 barrels landing on containment, the remainder on the well pad. Spilled fluids froze nearly immediately upon contact with the ground due to severe cold temperatures at the time. No spilled fluids left the well pad.

Johnson pad used as staging area for fraccing/flow back ops on Dan Ellis, according to Chesapeake. Pollution event related to this activity. Also production water from Johnson used for remedial work at Gowan. Violations were cited against the ES

Gas detected outside surface casing: 78.73(b) - General provision for well construction and operation; 78.85(a)(5) - Cement standards.
Arrived on site at 11:00, weather cold, wet, and windy. This inspection followed a call from Scott Cleveland on 4/25/14 informing me that elevated conductivity and some surface salt crystalization were found on the site and that Scott and colleagues were investigating the source. Completion ended on 2/6/14 at the location and involved all six gas wells which are now in production.

There were a number of areas of thick rutted mud on the location and since it was raining, there were numerous puddles. For the most part, it was difficult to obtain a field conductivity reading < 1mS/cm. The highest levels appeared to be near the gas wells, with 11mS/cm immediately SE of the cement pad, near the methanol units. Conductivity levels in the puddles between the gas wells and the production units ranged from 9mS/cm to 5mS/CM at the time of my inspection. I took 3 water samples (sample locations listed below).

The result of this inspection is pending receipt of the analytical data.

release of approx. 70 gallons of defoamer to well pad surface
release of approx. 70 gallons of defoamer to well pad surface

This administrative inspection has been created to document Chesapeake’s remediation of the diesel fuel spill of approximately (5-10) gallons which occurred on the Rainbow Bra Pad on 4/24/2014. A review of the remediation summary report submitted by Chesapeake indicates that the remediation was adequate. No further action is required of Chesapeake at this time.

On 04/01/15 I conducted an administrative review of the Champion Processing Pad A location. The ESCGP permit # ESX 09-125-0059 expired on 11/24/14.Through investigation it was determined that Chesapeake Appalachia LLC had submitted an Application for Transfer of the permit to Rice Energy, but the transfer was denied due to the permit being expired. Chesapeake Appalachia LLC was notified of the denial by the Department.

The operator has failed to construct the access road as permited. The site has not been transferred to SWN and is still held by Chesapeake Appalachia. The SWN request for termination of the ESCGP 1 permit is denied at this time.

102.11 Violation cited to ESCGP2 for erosion and lack of water infiltration in lower basin.

At time of inspection, arrived on site at 15:10p.m. to conclude the 72hr. Pressure Build-up Test (PBUT) being performed on the 2H and the 5H as part of an ongoing migration investigation. The cellar had water at the bottom with no bubbling noticed. I was accompanied by Eric Rooney (DEP Geologist), we met with Joel Mincer (lease operator for Chesapeake) and Tom Messing of Leidos. The 5H was shut in on 6/13/16 at 13:00p.m. and the 2H was shut in on 6/13/16 at 16:00p.m. Eric used an Altair 5X gas meter calibrated on 6/15/16 and Tom used a Gas Explorer gas meter calibrated on 6/16/16 to check for gas show at all annuli's. Gas samples were taken if gas was detected. Pressures were taken from the SCADA digital pressure gauges on the wells.
I left the site at 16:30p.m.

I left the site at 16:30p.m.
Sustained presence of gas within the (20x13) and (13x9) cemented annuli.

Break in over-land water line created accelerated erosion along bank of access road. Operator corrected violation prior to inspection.

Arrived @ 11:27. Weather: sunny and windy. This site had a total of 6 wells spudded: 4 wells TD'ed in July 2015 and two producing wells. On July 31, Chesapeake reported bubbling in cellars of the Folta S Bra 1H and Folta S Bra 3H, 2 of the 4 recently drilled wells. Previous inspections confirmed this bubbling (08/03/15), documented sample collection by Chesapeake (8/5/15) and documented the results of a 72-hour PBT (10/19/15). For this inspection, accessible annular vents were monitored using an Altair 5X gas meter calibrated on 1/27/16.
Folta N Bra 3H
Frozen water in cellar.
20" x 13-3/8": venting through 2" check valve – 3% methane
13x3/8" x 9-5/8": venting through 2" check valve – 100% methane.
9-5/8" x 5-1/2": shut-in.
Arrived @ 09:40, weather: sunny, snow on the ground. There were 6 wells on site. The four wells drilled in 2015 had recently been fracced. All were shut-in at the time of my inspection. Onsite were workers with ESSi Corp, AMI, and Control Tech. Spoke with Tad Gonzales (Essi Corp) who was installing remote instrumentation at the time of my inspection. For this inspection, accessible annular vents were monitored using an Altair 5X gas meter calibrated on 12/6/16.
Folta N Bra 3H
Cellar water filled, no bubbles.
20" x 13-3/8": venting through 2" check valve -- 0% methane
13x3/8" x 9-5/8": venting through 2" check valve – 22% methane.
9-5/8" x 5-1/2": shut-in.

11/2/2016 - Inspection conducted on well #063-30398. Production casing defective and leaking/venting gas to the atmospere. The Operator Chestnut Ridge Energy tried to patch the hole in the production casing with a tie down strap.
11/2/2016 - Inspection conducted on well #063-30398. Production casing defective and leaking/venting gas to the atmospere. The Operator Chestnut Ridge Energy tried to patch the hole in the production casing with a tie down strap.
11/2/2016 - Inspection conducted on well #063-30398. Production casing defective and leaking/venting gas to the atmospere. The Operator Chestnut Ridge Energy tried to patch the hole in the production casing with a tie down strap.

Site visit was result of spill notification by Nick Staffieri of Chevron on August 13, 2011.
Oil based drilling mud was spilled on containment (approximately 1 barrel). Spill was contained and removed. Upon its removal a hole in the containment liner was observed. It was determined that approximately five gallons of mud made it to the pad. At time of the inspection ES&G Environmental and Moody and Associates were doing an analysis of the spill area following Act 2 parameters. All contaminated materials were in sealed roll of boxes.

Inspection result of reported incident received by myself (as well as Marc Maestra) via phone call on Tues November 1, 2011 at 1050am from Chad Eisenman of Chevron. He called to provide notification of a discharge/release of an undetermined amount of flow back on to the grounds of the commonwealth. He stated that it is believed that secondary containment located beneath frac tanks overflowed. At the time of phone call no further data was available.

At the time of inspection, Chevron Regulatory Compliance personnel onsite, as well as KMI trucking with vac trucks. Well sign, ES plan ,PPC plan onsite. It appears that flow back (still undetermined amount) did indeed overtop secondary containment, at this time no "liquid" present on pad, several small puddles noted outside of containment and along access road. Noted minor staining on pad and roadway

Inspection result of reported incident received by myself (as well as Marc Maestra) via phone call on Tues November 1, 2011 at 1050am from Chad Eisenman of Chevron. He stated that it is believed that secondary containment located beneath frac tanks overflowed. At the time of phone call no further data was available.

At the time of inspection, Chevron Regulatory Compliance personnel onsite, as well as KMI trucking with vac trucks. Well sign, ES plan ,PPC plan onsite. It appears that flow back (still undetermined amount) did indeed overtop secondary containment, at this time no "liquid" present on pad, several small puddles noted outside of containment and along access road. Noted minor staining on pad and roadway

On March 9, 2012, the Department received a complaint about alleging run-off from Chevron's Hartley site getting into a privately owned farm pond. On March 14, 2012, WQS Bill Keefer, WQS John Ley and I investigated.

When we arrived at the farm, we found no one home but we walked down to the pond anyway. The pond was still off-color and it appeared that there was some sediment in the small stream that fed it.

We were called off the site due to an emergency but returned later in the afternoon and stopped at Chevron's Hartley site. Chevron was simultaneously filling a frack pond, vertical drilling a well and constructing the rest of the site.

There was an E&S plan in the tube in front of the site and a site sign. We found several areas where the triple silt sock was over-run. We also found bare areas where there were no E&S controls and areas sediment got off-site. There were also bare slopes that did not appear stabilized within the prescribed 4 days. These are all violations.

We left and I contacted Beth Smock about the problems.

Met onsite with operator representative Jarrod Shultz regarding the discharge of approximately 290 gallons of frac water (pre-stimulation). The water was an approximate mix of 90% freshwater and 10% reuse water. The spill resulted due to valves left open on the filtration system. The subsequent release was iniaitally contained on plastic, however due to improper construction the fluid did not flow back into the frac impoundment and was released onto the ground. Upon arrival onsite Chevron had ceased operations and was beginning to move the filtration equipment to access the area affected by the discharge. Excavation crew will be onsite as of the day of the inspection and upon completion of excavation of the affected media ECS&R had been contracted to perform confirmatory samples to insure that all affected media had been excavated. Operator incident report is attached to the inspection.

Hose failure resulted in 130 bbl spill.
At the time of inspection the well has been drilled and stimulated. The Operator was in the process of equipping the wells for production. The Department notes that the Drill Pit located onsite has been backfilled. The final report addressing the torn

On 12/9/2013, I performed an inspection of Chevron Lanco 6H-8H well pad site. The site is located in Dunkard Twp., Greene County. The inspection was performed as a routine inspection.

The New Act 9 Site ID sign was in place and legible.

Operator has submited a major modification to the ESCGP 1 permit, and I hard a copy of the modification submital on site.

The well pad, and access road were in good condition and all E&S controls were completed and adequate.
The constructed access road was outside the original LOD in two locations and the operator had constructed a production pipeline across the well pad and access road, without approval with a major modification to the permit.

On 3/18/2014, I performed an inspection of Chevron Nied well pad site. The site is located in Greene Twp., Greene County. The inspection was performed because of reported spill on 3/18/14.

On 3/18/14 the operator reported a spill of approx. 1,500 barrels of frack water to containment and approx. 10 barrels left containment and was spilled to the well pad in 5 different locations. The fluid did not migrated off the well pad. The operator was in process of excavating visibly impacted soil and sampling the soils to ensure that all impacted material was cleaned up during the site inspection. Operator is storing impacted material on site in sealed dumpsters in containment for disposal upon approval.

Chevron continued to use sources of water after the Department notified them that the sources were not valid. They withdrew water on 15 days after our notification.
Chevron continued to use sources of water after the Department notified them that the sources were not valid. They withdrew water on 15 days after our notification.
Inspection in response to a 50 gallon spill reported on 4.23.2014. The Department notes that the Operator is in compliance with the current spill policy for a reportable spill. During the inspection the Department observed an excavated area approxi

On 5/12/2014, the Department conducted an inspection at Chevron Appalachia's Frankhouser Well Site in Luzerne Twp., Fayette County.
The site ID sign was in place at the site entrance. The 3H, 4H, 5H, and 6H have all been drilled and were labeled. The wells are in production. Three brine tanks were at the location and were in secondary containment.
There are two sed traps still in place on site and the diversion channels leading to them were still in place. The perimeter silt sox are still in place. The majority of the site does not have the 70% vegetative growth on it. Portions of the site have not been regraded to original contours.
On May 9, 2013, Chevron requested a well site restoration extension to a new restoration deadline date of 5/9/2014. The extension was approved. The operator failed to restore the site by the requested exteneded date of 5/9/2014 which is considered a violation.

On 7/10/2014, the Department conducted an inspection at Chevron Appalachia's Lee Well Site in Redstone Twp., Fayette County.

The site ID sign was in place at the site entrance. The 14H and 15H have been drilled and were labeled. The wells are in production. Two brine tanks are at the location and were in secondary containment.
There are diversion channels in the old impoundment area still in place. There are silt sox and hay bales still in place on both the pad site and the impoundment site. There are several areas of the impoundment site that does not have the 70% vegetative growth on it. There are some erosion gullies present on the old impoundment area field. The vegetation around the pad site is in good shape and has been mowed for hay down to the edge of the pad.
On June 7, 2013, Chevron requested a well site restoration extension to a new restoration deadline date of 7/8/2014. The extension was approved. The operator failed to restore the site by the requested exteneded date of 7/8/2014 which is considered a violation. The operator

On October 321, 2014, the Department received a complaint regarding drag-out and resulting road dust from Chevron's Point Marion water withdrawal site. On November 6th I contacted the complainant and received additional details.

On November 7, 2014, I stopped at the site to access the situation. The site is located on New Geneva Road about a ½ mile north of Point Marion (coordinates on front of report). I found a water withdrawal site that was currently handling two dozen trucks daily (at their peak it was over 100). These trucks were dragging mud from the site out onto the main road.

I called Nick Staffieri and he told me that he would have the lot re-stoned and the site cleaned-up.
I will schedule a follow-up inspection.

In a well that has defective, insufficient or improperly cemented casing, the operator shall report the defect to the Department within 24 hours of discovery by the operator and shall correct the defect. The operator shall correct the defect or submit a plan to correct the defect for approval by the Department within 30 days. If the defect cannot be corrected or an alternate method is not approved by the Department, the well shall be plugged under § § 78.91—78.98 (relating to plugging).

The operator (CHEVRON APPALACHIA LLC) did not notify the Department (Pennsylvania Department of Environmental Protection) of a defective primary casing cementing job within 24 hours on the Sargent 15H (API #37-125-26935) which occurred on or about May 8th, 2014.

On 05/08/15 at approximately 1030 hours I conducted a routine partial inspection of the Hoehn well site when I inspected the Howe pad. The liner for the impoundment had been removed. The soil underneath the liner exhibited characteristics indica

1) Approximately the first 60 feet of the access road entrance is paved. This paving is not identified on the Reclamation plan.
2) The access road culverts appear to be inverted in comparison to the Reclamation plan (i.e. the inlets and outlets are switched). Although these changes were red-lined by the Operator, these changes were not reviewed and/or approved by the Department.
3) There are, what appears to be two, subsurface PVC pipes installed under the access road near the gate. These pipes are not identified on the Reclamation plan. Mr. Small confirmed that these pipes were installed by the Opr. As no revisions and/or mods are currently on record to account for these alterations, viols are being issued under 102.5(m)(4) & 102.8.
Please see paper SAIR for full comments.

On 11/17/15 at approximately 1200 hours I conducted an inspection of the Donley Unit in response to a spill of 165 gallons of treated water that occurred on 11/15/15. The Act 9 sign was in place and all required documents were present in the mail box. The spill had been cleaned up at the time of inspection and Chevron had collected confirmatory samples.

According to Chevron's initial report, the spill occurred when on site treated water was being transferred from the Dyna Tanks to the Loading Tanks on an adjacent pad. During the transfer a 4" PVC plug on the external manifold on one of the loading tanks came out of the manifold. The failure of the plug allowed fluid to be released from the manifold and tank to both the tank secondary containment and the gravel pad surface.

The release is a violation of 78.54 and SWMA 301.

On 11/17/15 at approximately 1200 hours I conducted an inspection of the Donley Unit in response to a spill of 165 gallons of treated water that occurred on 11/15/15. The release is a violation of 78.54 and SWMA 301.

On 01/09/16 at approximately 0800 hours I conducted a routine partial inspection of the Grooms Unit. The Act 9 sign was in place and all required documents were present at the site. I met with Nick Staffieri of Chevron to discuss changes at the site.

One of the forebays on the site (#3) was moved within the same drainage area as proposed, but without Departmental approval. This is a violation of 102.5(m)(4). It is recommended that Chevron submit for a minor modification to reflect current
On the evening of 2/22/2016 the Department received a phone call reporting a fire in a gas production unit (GPU) on Headley # 9 – H well (051-25342).The department arrived on site 9:45am on 2/23/2016. A Chevron rep. was on site. The Depar

On 03/16/16 at approximately 0930 hours I conducted a complaint inspection of the Rejiss well site. The Act 9 sign was in place and all required documents were present at the site.

The site overall was well vegetated and there were no signs of erosion & sedimentation at the site. A significant amount of stone was also present on the slope of the topsoil stock pile at the southern corner of the well site. It is recommended that this be removed.

The complaint against the site alleged that it was not built to the specifications of the approved E&S plans and that the stockpiles were causing environmental concerns. No environmental harm was observed due to the stock piles. The site appears to have been built to plan with the exception of two locations of gravel that appear to be gravel pull offs. One is located near the main site entrance on the northeast side of the access road and the second is near the debris pile on the southwestern

On 04/14/16 at approximately 0830 hours I conducted an incident response inspection in response to a spill that occurred on 04/13/16. The Act 9 sign was in place and all required documents were present at the site.

On 04/13/16 a spill of 2/3 freshwater and 1/3 reuse water occurred. Approximately 55 barrels were recovered from containment. Chevron discovered that fluid leaked to the ground surface through a bad seam approximately 8" up the containment berm. After the fluid was recovered from the pad surface the faulty seam was repaired. The spill area off containment was excavated and the material placed on a liner and covered to prevent rain infiltration. Confirmatory samples were taken after excavation occurred. The spill volume to the ground was calculated at 30 gallons.

On 04/14/16 at approximately 0830 hours I conducted an incident response inspection in response to a spill that occurred on 04/13/16. The Act 9 sign was in place and all required documents were present at the site.

On 04/13/16 a spill of 2/3 freshwater and 1/3 reuse water occurred. Approximately 55 barrels were recovered from containment. Chevron discovered that fluid leaked to the ground surface through a bad seam approximately 8” up the containment berm. After the fluid was recovered from the pad surface the faulty seam was repaired. The spill area off containment was excavated and the material placed on a liner and covered to prevent rain infiltration. Confirmatory samples were taken after excavation occurred. The spill volume to the ground was calculated at 30 gallons.

On 10/14/15 I conducted a complaint inspection of the Mutnansky Unit in response to a complaint alleging that erosion had occurred at the site. At the time of inspection significant accelerated erosion was present. It was highly recommended that the issues present be addressed. I met with Mike Herman of Chevron at the site and he indicated that Chevron would be moving forward to address the issues at the site.

On 04/26/16 at approximately 1330 hours I conducted a routine complete inspection of the Mutnansky Unit. The Act 9 sign was in place and all required documents were present at the site. The accelerated erosion noted on 10/14/15 had not been repaired. It appears that a location part way up the pad slope was saturated and was the origin of the accelerated erosion. It is highly recommended that this be investigated.

On 08/09/16 at approximately 1430 hours I conducted a routine complete inspection of the Chevron Appalachia LLC Kieffer well site. The Act 9 sign was in place and all required documents were present at the site. The well pad was fenced, gated, and locked at the time of inspection.

Chevron had recently submitted a minor modification and Environmental Engineering Specialist Mohamed Sam found that the last major modification for the site was approved on 12/21/2010. As a result, the ESCGP-1 expired on 12/20/2015 with no record of an extension being requested or approved. An NOT was completed by WQS Ben Dillie on 10/09/2014 and in the report Dillie indicated the NOT was denied due to the well pad having not been reclaimed to post construction design. A violation of 102.7(c) has occurred for failure to terminate or renew the ESCGP.

An overlay exhibit submitted with the minor modification shows that the access road was not built in the permitted location. This is a violation of 102.5(m)(4). Additionally, an unpermitted access road was constructed coming off the north end of the pad. This is an additional violation of 102.5(m)(4).

On 08/09/16 at approximately 1430 hours I conducted a routine complete inspection of the Chevron Appalachia LLC Kieffer well site. The Act 9 sign was in place and all required documents were present at the site. The well pad was fenced, gated, and locked at the time of inspection.

MARCELLUS/Discharged drill mud/fluids onto ground
MARCELLUS/Discharged drill mud/fluids onto ground
Complaint 263047 investigated, unreported off site drilling mud spill identified. This is a violation of the Rules and Regulations of the Department. See Insp ID 1816406 conducted 7/27/09. MBC 08/06/2009
The following items were noted during the inspection:
-Moving out rig in process.
-Met onsite with Mr. Mike Unrein, Asst. Area Manager, Patterson UTI Drilling
-Inspected reported anti-freeze spill area near center of drill pad, 50 gallons
-Mr. U indicated it was environmentally safe ¿Red¿ antifreeze.
-Found small area of rock stained (~ 15 feet in diameter)
-No detectable odor, (took)pic
-3rd party clean up company contacted to remove soil, take soil samples for testing and dispose of soil.
-Spill caused by winch cable breaking while loading generator pack on truck.
-Gen-pack fell and 4¿ antifreeze pipe broke (took pic). Leak stopped & repaired quickly.

Failure to implement and maintain BMPs, plan inadequate, sedimentation of vernal pool / wetland area and unauthorized minor and major modifications of ESCGP. See Insp ID 1829756 conducted 9/22/09, past violations corrected. MBC 9/23/09

3rd page NOV. MAB
Silt fence need repair, silt fence not installed correctly, missing sed trap BMP (probably removed by pipeline construction crew). E&S plan not reflecting site conditions. Assoc NOV closed 1/15/14, viols had been resolved since 7/21/2010 & no subse silt fence in disrepair. silt fence not covering downslope of full earth disturbance activity. silt fence not installed correctly - not turned upslope on 45 degree at both ends. drainage ditch not properly stabilized. cuttings blown outside of pit and drainage silt fence in disrepair. silt fence not covering downslope of full earth disturbance activity. silt fence not installed correctly - not turned upslope on 45 degree at both ends. drainage ditch not properly stabilized. cuttings blown outside of pit and drainage JC-Insp revealed no E&S plan on-site during earthmovong activities, 102.4(b)(7), and no well permit number or operator info posted on-site, O&G Act 601.201(g).

Abandoned, no WRCR; Failure to comply w/ permit conditions

Water transfer line - released full volume directly into 2 streams
Water transfer line - released full volume directly into 2 streams
Water transfer line - released full volume directly into 2 streams

Met on site first with Tool Pusher Trey Villarreal.
Mr. Villarreal informed me of a spill of drilling cuttings that were leaking from the shakers approximatley 10' from the pit.
I also noted a small spill from where the mud was transferred from a truck to the tanks.
This is a small spill that just needs to be cleaned up.
I later met with Don Henson, and Matt Barch, the Enviromental Compliance Specialists from Chief Oil and Gas.
Inspected BOP Test from 1/20/10
Patterson Rig 255 is currently drilling an 8 3/4" hole through the curve at 6687'
Rig will be moving to Somerset for the next well.
Matt and I again went to inspect the spill at the shakers and discussed what steps would be taken to seal the area where the spill is coming from. A piece of rubber has been ordered to seal the leak to prevent future cuttings loss. Also, there water that is being sprayed onto the location due to the high wind in the area. The discharge line needs to be set closer to the pit liner so that the wind can not carry the water out of the pit.

work over rig on location drilling cement out of inside of casing. hit cement at 301 ft deep. they never notified dept of cement job or their plans on how they were going to fix it.
work over rig on location drilling cement out of inside of casing. hit cement at 301 ft deep. they never notified dept of cement job or their plans on how they were going to fix it.

-E&S plan on site, Compost sock on dowslope edge of location, diversion ditches run the perimeter. The ditches are unlined, and carrying large amounts of sediments. The heavily sedimented water is discharging through a swell in the adjacent fiel

Several spills onto the ground surface (diesel fuel, cuttings, brine, an unknown gel), freeboard violation, holes in pit liner, failure to minimize potential for accelerated erosion

No activity on site. Reserve pit still present. Fence around pit needs repair. Four 55-gallon steel drums on southern portion of pad. One drum leaking onto ground. Drums labeled gear oil. Violation cited for unpermitted discharge of industrial wast

During inspection well site was properly signed with E&S plan and ESCGP-1 onsite. Operator reported a spill (on 7/7/10 at 1600hrs) of approx 30 gallons of oil based mud. Violations will be issued for the release of pollutant onto the grounds of the c
Well Tag
There was no well tag on this well or the other two wells completed on the pad. According to58 P.S.§ Section 601.201(h), ¿The well operation shall install the permit number issued by the department in a legible, visible and permanent manner on the well upon completion.¿

Please install well tags on wells as required.

MouseHole not filled in
According to PA Code 78.65 (1), ¿A drill hole or bore hole used to facilitate the drilling of a well shall be filled with cement, soil, drill cuttings or other earthen material before moving the drilling equipment from the well site¿.

Please fill in mouseholes as required.
See violations cited and inspection report in file
cuttings and frac chemicals on the ground, pit has rock subbase and holes in the liner
No well tag, cuttings on ground, pollutional substances in cellar, pit has holes in liner and lacks required 2' freeboard
No well tag, oil spill on ground
Cuttings and oil stains on pad, pit liner has holes in it.
Pit has holes in liner, oil/hydrocarbon spills on well pad

Hydrocarbon spills on well pad

Follow up inspection for purported flowback spill, same violations from last inspection still occurring
Follow up inspection for purported flowback spill, same violations from last inspection still occurring

Inspected well head. Cellar has 1' water in bottom. Observed gas coming to surface on outside of 13 3/8" casing. Well is shut in and has not been fracced yet. Operator was notified of condition on 10/8/10 after DEP inspector McShea visited the
Soil stockpile on site not stabilized, rat hole not filled, cuttings/drill mud/litter all over ground
Soil stockpile on site not stabilized, rat hole not filled, cuttings/drill mud/litter all over ground

NOV. Sample results show a release of a fluid other than fresh water.

to partially to completely cover the bottom of the tank. While the exact nature of the fluid is not known, the presence of a sheen, odor, and suspended components indicate that it is not fresh water. No fluid was accessible for electrical conductivity screening or collecting a sample.

Title 25 Pa. Code § 78.54, which relates to control and disposal of residual waste, requires that all wastes produced during any phase of well development or operation be controlled and disposed of in a manner that prevents pollution to Waters of the Commonwealth. Further, 35 P.S. § 691.402(b) (Clean Streams Law) requires that any activity regulated by a permit issued pursuant to the Clean Streams Law prevent the potential of pollution of Waters of the Commonwealth. Since the tanks containing the fluid were not located within containment the potential to pollute Waters of the Commonwealth exits, and is in violaton of 25. Pa. Code § 78.54 and 35 P.S. § 691.402(b). Additionally, 25 Pa. Code § 91.34(a) requires that permittees take all necessary measures to prevent spills, including the use of diking, containment, or other measures. The absence of containment mentioned above is also in violation of 25 Pa. Code § 91.34(a).

Chief should take steps to ensure that the subject tanks do not pose a risk of potential pollution. Chief should provide a written explanation of why the tanks were placed at the Kuziak B Freshwater Impountment, a description of the nature of the fluid within the tanks, and a description of the measures that were undertaken to address the violations cited in this report.

Arrived @ 10:30. Weather: sunny, warm. No company representatives were present during the inspection. There were 2wells and a small compressor on the site. The Kuziak 1H was in production with artificial lift. This follow-up inspection was prompted by an Inactive Well Status application for Kuziak Unit 7V. Previously on 6/30/16, combustible gas was detected on the Kuziak Unit 1H well at the 13-3/8" x 9-5/8" annulus. Typically, the 1" , 13-3/8" x 9-5/8" annular vent T's into the 2" 13-3/8" x 9-5/8" annular vent, allowing for cross-contamination. To eliminate that possibility in this follow-up inspection, the annuli were open and isolated from each other prior to my arrival on site. Monitoring was conducted with Altair 5X gas meter (calibrated: 7/26/16).
Kuziak 1H .13-3/8" x 9-5/8": 17%/volume combustible gas, 9-5/8" x 5-1/2": 9%/volume combustible gas.
The combustible gas detected at the 13-3/8" x 9-5/8" annuli of the Kuziak 1H well is evidence of defective cement which is a violation of Title 25 §78.86 – Defective casing or cementing. which states: "In a well that has defective, insufficient or improperly cemented casing, the operator shall report the defect to the Department within 24 hours of discovery by the operator and shall correct the defect.
The operator shall correct the defect or submit a plan to correct the defect for approval by the Department within 30 days. If the defect cannot be corrected or an alternate method is not approved by the Department, the well shall be plugged under §§ 78.91-78.98 (relating to plugging)."
Left location @ 11:00.

Preoperational inspection conducted at the request of Chief Oil & Gas. Keith Kimball and Merle Wade of Chief were present during the inspection.

All erosion and sediment control BMPs are in place as permitted and in good repair. Temporary stabilization is in place on the disturbed areas of the site, and germination of the seed mix was evident over most of the site. Grading and compaction of the final layer of rock ono the well pad surface was nearly complete.

A backhoe with staining on the side and track below the fuel port was parked along the site access road. Upon closer investigation, the staining was observed to be from deisel fuel, and a small area of staining on the ground surface was noted. Judging by the extent of the staining the amount of spilled fuel was less than 5 gallons. Since staining from the spilled fuel was observed on the ground surface, this release had the potential to pollute waters of the Commonwealth, which is in violation of 35 P.S. § 691.402(b). Title 35 P.S. § 691.402(b) prohibits conducting activites regulated by permits issued pursuant to Section 402 of The Clean Streams Law to prevent the potentail of pollution contrary to the issued permits or without a permit. Further, since the spill likely occurred during refueling and would have been prevented if containment were being used during refuling, the release is also in violation of 25 Pa. Code § 91.34(a), which requires permittees to take measures to contain pollutants.

Mr. Wade of Chief was present during discovery of the spill and indicated he would have the affected soil removed immediately. I stated that contractors should be reminded tthat they must comply with the site Pollution Prevention and Control Plan at all times. Since the soil affected by the spill was removed immediately after discover, the violations noted above are considered immediately corrected.

Since the soil affected by the spill was removed immediately after discover, the violations noted above are considered immediately corrected.
This partial inspection was conducted to assess conditions at the access road crossing of a Unnamed Tributary (UNT) to Elk Creek (EV-MF, supports natural trout reproduction) that was washed out during heavy rains on 10/20 - 10/21/2016. Localized amounts of rainfall during that storm event ranged from 4-6 inches during a period of less than 12 hours. It was raining at the time of inspection. No Chief representatives were present during the inspection.

The box culvert has been replaced, and the road bed is being reconstructed. This work was authorized by Emergency Permit No. 57-16-501, issued by the Department on 10/24/2016. At the time of inspection, temporary stabilization was in place on a portion of the area disturbed by the construction activities, though some areas had not yet been stabilized. Compost filter sock was in place along the bottom of the disturbed area on the south side of the creek, but not the north. The roadside ditch on the north side was re-graded but rock had not yet been installed in the ditch, and at the time of inspection it was observed to be discharging sediment into the UNT to Elk Creek. I recommended to the contractor that compost filter sock should be installed to prevent the discharge. The contractor indicated they would install a filter sock at the bottom of the ditch.

Erosion and sediment (E&S) control measures should have been installed prior to the commencement of any earth disturbance associated with repair of the road and culvert. This is in violation of 25 Pa. Code § 102.4(b)(1) and § 102.11(a)(1) which require the implementation of E&S BMPs to prevent accellerated erosion and sedimentation and protect water quality and existing and designated uses. The observed discharge is also in violation of 35 P.S. § 691.401, which prohibits the discharge of substances of any kind or character into waters of the Commonwealth.

The observed discharge is also in violation of 35 P.S. § 691.401, which prohibits the discharge of substances of any kind or character into waters of the Commonwealth.

Follow-up inspection conducted after receiving laboratory analysis of fluid samples collected during last inspection (Inspection ID No. 2518947, September 14, 2016). No Chief representatives were present during the inspection.

During the September 14, 2016 inspection, fluid samples were collected from a puddle on the well pad in response to field electrical conductivity readings of 3.4 mS/cm. The puddle was located along the east edge of the well pad. No sheen was present on the puddle, and no staining or odors were observed. Chief was notified of these findings, and had all puddles on the pad vacuumed and removed.

The laboratory analysis (SAC 942) indicates elevated levels of chlorides (1,713.1 mg/L), strontium (25,830 ug/L), iron (1,130 mg/L), total dissolved solids (3,050 mg/L), and manganese (22.55 mg/L). Elevated levels of these constituents indicate that a release of produced water or flowback occurred on the well site.

Electrical conductivity was screened in the same area where the elevated readings were observed during the September 14th inspection. The range of readings during this inspection ranged from 260 uS/cm to 490 uS/cm, which is more typical of the electrical conductance of surface puddles of rainwater.

Since flowback or produced water was spilled on the pad surface, this release had the potential to pollute waters of the Commonwealth, which is in violation of 35 P.S. § 691.402(b). Title 35 P.S. § 691.402(b) prohibits conducting activities regulated by permits issued pursuant to Section 402 of The Clean Streams Law to prevent the potential of pollution contrary to the issued permits or without a permit. Though containment was in use on the site, the existence of contaminated fluids off the containment indicate improper handling of wastes or inadequate installation or maintenance of the containment. Thus, this release is in violation of 25 Pa. Code § 91.34(a), which requires permittees to take measures to contain pollutants.

Since action was taken to promptly remove the affected fluids from the well pad surface, the violations cited above are considered immediately corrected.

Follow-up inspection conducted after receiving laboratory analysis of fluid samples collected during last inspection (Inspection ID No. 2518947, September 14, 2016). No Chief representatives were present during the inspection.

During the September 14, 2016 inspection, fluid samples were collected from a puddle on the well pad in response to field electrical conductivity readings of 3.4 mS/cm. The puddle was located along the east edge of the well pad. No sheen was present on the puddle, and no staining or odors were observed. The laboratory analysis (SAC 942) indicates elevated levels of chlorides (1,713.1 mg/L), strontium (25,830 ug/L), iron (1,130 mg/L), total dissolved solids (3,050 mg/L), and manganese (22.55 mg/L). Elevated levels of these constituents indicate that a release of produced water or flowback occurred on the well site.

Electrical conductivity was screened in the same area where the elevated readings were observed during the September 14th inspection. The range of readings during this inspection ranged from 260 uS/cm to 490 uS/cm, which is more typical of the electrical conductance of surface puddles of rainwater.

Since flowback or produced water was spilled on the pad surface, this release had the potential to pollute waters of the Commonwealth, which is in violation of 35 P.S. § 691.402(b). Title 35 P.S. § 691.402(b) prohibits conducting activities regulated by permits issued pursuant to Section 402 of The Clean Streams Law to prevent the potential of pollution contrary to the issued permits or without a permit. Though containment was in use on the site, the existence of contaminated fluids off the containment indicate improper handling of wastes or inadequate installation or maintenance of the containment. Thus, this release is in violation of 25 Pa. Code § 91.34(a), which requires permittees to take measures to contain pollutants.

Since action was taken to promptly remove the affected fluids from the well pad surface, the violations cited above are considered immediately corrected.

ground surface. The spilled fluid was immediately removed with a vacuum truck and the affected pad substrate was excavated and removed. New gravel was put in place.

Mitigation efforts had been completed at the time of my inspection. New gravel was evident at the location of the spill. No odor or staining that could indicate residual contamination was noted.

Because the brine spilled on the pad surface, this release had the potential to pollute waters of the Commonwealth, which is in violation of 35 P.S. § 691.402(b). Title 35 P.S. § 691.402(b) prohibits conducting activities regulated by permits issued pursuant to Section 402 of The Clean Streams Law to prevent the potential of pollution contrary to the issued permits or without a permit. Further, since the spill occurred off of containment during removal of the produced water tank this release is in violation of 25 Pa. Code § 91.34(a), which requires permittees to take measures to contain pollutants.

Since actions were taken to promptly remove the released fluids from the well pad surface and remove and replace the affected pad substrate, the violations cited above are considered immediately corrected.

ground surface. The spilled fluid was immediately removed with a vacuum truck and the affected pad substrate was excavated and removed. New gravel was put in place.

Mitigation efforts had been completed at the time of my inspection. New gravel was evident at the location of the spill. No odor or staining that could indicate residual contamination was noted.

Since actions were taken to promptly remove the released fluids from the well pad surface and remove and replace the affected pad substrate, the violations cited above are considered immediately corrected.

Follow-up inspection conducted after receiving laboratory analysis of fluid samples collected during the last inspection (Inspection ID No. 2525835, October 06, 2016).

During the October 06, 2016 inspection, fluid samples were collected from a puddle on the well pad in response to field electrical conductivity readings of 5.2 mS/cm. The puddle was located near the northeast edge of the well pad in front of the produced water tanks. No sheen was present on the puddle, and no staining or odors were observed. Chief was notified of these findings, and had indicated to the Department of Environmental Protection (DEP) all puddles on the pad had been vacuumed up and removed. The laboratory analysis (SAC 942) indicates elevated levels of chlorides (3,598.8 mg/L), strontium (44,490 ug/L), iron (109.2 mg/L), and total dissolved solids (3,994 mg/L). Elevated levels of these constituents suggest that a release of produced water or flowback likely occurred on the well site.

Follow-up inspection conducted after receiving laboratory analysis of fluid samples collected during the last inspection (Inspection ID No. 2525835, October 06, 2016).

Partial inspection conducted due to observation of trailer with regulated substances on-site without containment. No Chief representatives were present.

I observed a trailer with two totes of oil on the well site when turning around at the well site. One tote was approximately halfway full and the other was full. No containment was in place beneath the trailer, and a small drip of oil was noted beneath the trailer on the well pad surface. Title 25 Pa. Code § 91.34(a) requires persons engaged in activities that include, among other things, the transportation and storage of pollutants take measures to prevent the substances from directly or indirectly reaching Waters of the Commonwealth. I informed Chief of the situation, and Chief indicated that the trailer would be placed within containment as soon as possible. On 12/23 Chief informed me that the trailer had been placed within the containment.

Since containment was not in place under the totes, the conditions observed constitute a violation of the Section 91.34(a). Because the trailer was moved promptly onto containment, this violation is considered immediately corrected.

At the time of this inspection, well drilled and in prodcution. Well tag present. Drilling completed 1/8/06. Site restored with adequate vegetation. No accelerated erosion or sedimentation issues noted. Department observed a "puddle" bottom of brine tank near valve. After closer examination department observed a "Steady slow leak" from brine tank. Department tried to call operator but recieved answering machine, no message left. At approximately 1330 depaartment was able to locate an emergency number for operator. Deaprtment left a message with answering service of brine release at said well. Aprroximately 1-1/12 later Christine Marie Rep returned my call and was promptly gonig to have the tank pumped out and adddress the issue. A follow up will be conducted in the am to ensure proper cleanup measures are executed.
At the time of this inspection, well drilled and in prodcution. Well tag present. Drilling completed 1/8/06. Site restored with adequate vegetation. No accelerated erosion or sedimentation issues noted. Department observed a "puddle" bottom of brine tank near valve. After closer examination department observed a "Steady slow leak" from brine tank. Department tried to call operator but recieved answering machine, no message left. At approximately 1330 depaartment was able to locate an emergency number for operator. Deaprtment left a message with answering service of brine release at said well. Aprroximately 1-1/12 later Christine Marie Rep returned my call and was promptly gonig to have the tank pumped out and adddress the issue. A follow up will be conducted in the am to ensure proper cleanup measures are executed.

UPDATE: 3/8/2013
Mr. Manners contactedDept and stated that the fluid levels had not decreased in the previous week.
UPDATE: 3/22/2013
CNX rep Jamie Komonich contacted Dept and stated valve had been leaking on day spill reported and he estimated a brine loss of 35 bbl.He stated that sampling for elevated chlorides in surrounding soils will be conducted, Dept recommends that site-specific background samples are used for comparison purposes. Dept requests that upon analysis, results be submitted.Dept recommends Opr conduct inspection of tank and associated equipment to ensure structural integrity is not compromised.
Violations are being issued for a reportable release of brine under 91.54A, 78.54, 78.57A, SWMA 301.

Follow-up to admin inspection ID 2159986 for 4/13/13 spill incident.
Adjacent to Marchand Compressor Site.
At time of inspection, impacted soils excavated and located in one on-site roll-off box. According to Operator, excavation occurred on 4/16/2013 by McCutcheon.
Brine tank removed, contained on black tarp. Fluids from tank stored in two on-site totes awaiting disposal.
Violations are being issued for a reportable release of residual fluids under PA CODE 78.54 in addition to SWMA 301.

~75 gallon diesel fuel release to the ground from tank being moved across pad via forklift. Tank tipped off and fuel was released through the 2" vent opening on top of tank. Remediation and excavation response occurred while DEP was onsite.
On-site inspt in response to reported release of 21 gallons of crude oil/brine.CNX rep Ryan Scrips reported spill to WQS Samantha Foulk on 4/30/2013 at 2:50pm. Mr. Scrips reported that nipple connecting valve on production tank had rusted out and was immediately repaired. Release was discovered during welltender's once-a-month check.

No visible brine observed. Oil still present within vegetative dike and underneath tank. Approximately seven absorbent pads partially covering released oil. Oil extending approximately four feet straight out from valve and then extending approximately six feet to the left of tank when facing valve. Oil remaining on permeable soils with no observable measures of clean-up being taken.

No active leaks detected at this time.
Ruts forming along access road due to recent increased traffic. Dept recommends Opr maintains AR to prevent any potential E&S pollution events from occurring.

Violations are being issued for this reportable release of brine/residual fluids under PA CODE 78.54 in addition to 78.57, 91.34, SWMA 301

Inspection the result of a spill reported to the Department by the Operator. At 00:45 on 6/11/2014 the Operator reported an unknown amount of friction reducer spill to the ground via a rain fall event and hole in the containment. At the time of inspec
Please see paper SAIR for comments.
Please see paper SAIR for comments.
Inspection the result of a spill reported by the Operator on 8/12/2014 at 16:00. The Operator reported a brine spill of approximately 30 gallons. At the time of inspection the department observed two brine tanks manifolded together via a 2" steel pipe
On 8/22/2014, I performed an inspection of CNX Morris to Majorsville pipeline site. The site is located in Richhill Twp., Greene County. The inspection was performed because of an earth movement on the pipeline right of way.

The operator informed the DEP that a slide at a stream crossing for a unnamed trib. to Enlow Fork had occured. The slide material has caused the BMPs to fail and has entered the stream.

The operator was monitoring the site and is preparing plans to apply for an emergency 105 permit to address the slide and impacts to the stream channel.

Enforcement ID/order 315144
Enforcement ID/order 315144

On-site inspection in response to admin inspection record 2307647 for the reportable release of 3-4 bbl brine to the ground from a production tank.

At time of inspection, all visibly impacted materials appear excavated. Area of excavation located down-gradient of brine tank, not yet backfilled.

Two well labels present. Department recommends Operator ensure tags are labeled consistently. According to records, drilling occurred 6/27/1958-9/08/1958. Brine tank on-site.

Access road stable, gated. Department recommends Operator continues to monitor and maintain access road and well site as necessary.

A follow-up inspection will be conducted in the future to ensure site is properly remediated and restored.

Violations are being issued for this reportable release of production fluids.

At this time, the Department is requesting the Operator submit all disposal records and manifests upon final disposition of wastes.

regulator (Big Joe)over pressure or fatigue causing the source of gas.The safety equipment work as designed although serious damage occured. The seperation unit has been completely dismantle to be removed off site. the ignition soure is unknown at present time .78.73. General provision for well construction and operation.
(a) The operator shall construct and operate the well in accordance with this chapter and ensure that the integrity of the well is maintained and health, safety, environment and property are protected.

Inspection performed as a follow-up to a spill/discharge notification reported to the Department by the operator outlining a release of approximately 10 barrels (420 gallons) of produced fluids. Inpsection confirmed the reported details of the spill. Sp
On 6/15/2015, I performed an inspection of CNX Gas Co., LLC NV15/17 Centralized Impoundment water transfer line site. Present at time of inspection was Travis Rastoka and Craig Bland (CNX). The site is located in Morris Twp., Greene County. The inspection was performed as a response to a reported impaired water spill by the operator.

The operator intially reported an unknown amount of impaired water from a water transfer line from the NV15/17 CI to the GH56 AST tank used for fracking operations at the GH56, on 6/12/15. The impaired water has saturated a area approx. 20'x80' . The operator has begun cleanup activity and field soil sampling to characterize the site for cleanup.

On 6/15/2015, I performed an inspection of CNX Gas Co., LLC NV15/17 Centralized Impoundment water transfer line site. Present at time of inspection was Travis Rastoka and Craig Bland (CNX). The site is located in Morris Twp., Greene County. The inspection was performed as a response to a reported impaired water spill by the operator.

The operator intially reported an unknown amount of impaired water from a water transfer line from the NV15/17 CI to the GH56 AST tank used for fracking operations at the GH56, on 6/12/15. The impaired water has saturated a area approx. 20'x80' . The operator has begun cleanup activity and field soil sampling to characterize the site for cleanup.

On 6/15/2015, I performed an inspection of CNX Gas Co., LLC GH9 well pad site. Present at time of inspection was Ken Villena, Ken Cerny, Kyle Borden, and Adam Salyers (CNX). The site is located in Center Twp., Greene County. The inspection was performed as a response to a reported impaired water spill by the operator.

The operator intially reported a spill of approx. 10 barrels of impaired water from the drill flow lines and cuttings storage tanks during the drilling of the GH9 AHSU well on 6/14/15. During drilling operations and attempts to retrieve the drilling motor a kick-back caused the well to unload drilling water through the flow back lines. Impaired water was discharged off containment to the well pad. The impaired water traveled a collection ditch and left the well pad and was discharged on the well
Well appeared to be equipped for production at the time of the inspection. Brine tank located onsite and it appeared to be in sound condition. Due to recent precipitation events and inaction by the operator after receipt of the 05/08/15 inspection rep

At time of inspection, drilling not yet commenced. The well site does not appear to be completed and/or constructed as outlined in the E&S plan approved by the Department.
This ESCGP-2 was issued on 9/24/2013. A major revision to this permit was approved on 3/27/2015. This permit expires on 3/26/2020.
Violations are being issued for Operator's failure to have a copy of the well permit(s), ESCGP-2, E&S/PCSM plan, PPCP, weekly BMP inspection reports, and ERP on-site, failure to have the well permit number(s) posted, failure to have a Site ID sign posted, failure to implement the E&S plan as designed, failure to implement and maintain E&S BMPs to minimize the potential for accelerated erosion and sedimentation, and for failure to comply with the standard ESCGP-2 permit conditions.

VIOLS ISSUED UNDER 3211(a), 3211(g),102.4(b)(8), 102.4(b)(2), 102.5, 102.11(a)(1), 78.55(f)(5)(vi), 78.55(f)(4)(i).

Additional comments on paper SAIR.

On 7/16/15, I performed an inspection of CNX GH46 well pad site. The site is located in Center Twp., Greene County. The inspection was performed as a routine inspection of the site.

Collection channel along access road has heavy sediment load in the channel. Noted past discharge of sediment onto and along Jacobs Run Rd. Evidence of noted past discharge of sediment from site onto the neighboring property near the access road entrance. Neighboring landowner indicated that during rainfall events sediment discharges off site onto his property and stream. Landowner provided the department with photographs of site from the previous three weeks of site conditions during precipitation events. The operator has discharged sediment off site and into Jacobs Run a high quality watershed.

Weather Conditions: Sunny 85 degrees with no precipitation.

On 7/30/15, I performed an inspection of CNX GH46 well pad site. On site during the inspection was Ken Villena and Jamie Komonich (CNX). The site is located in Center Twp., Greene County. The inspection was performed as an inspection of the site because of a reported reuse water spill on site by the operator.

The operator reported a spill of approx. 1 barrel of reuse water spilled to the well pad. During the inpsection it was determined that a much more significant spill had occurred and the operator could not give a time frame or amount of the spill. The amount is unknown. During the inspection the reuse water was continuing to discharge off of containment to the well pad, well pad collection ditch and sediment trap.
Weather Conditions: Sunny 85 degrees with no precipitation.

The inspection was performed as an inspection of the site because of a reported reuse water spill on site by the operator.

The operator reported a spill of approx. 1 barrel of reuse water spilled to the well pad. During the inpsection it was determined that a much more significant spill had occurred and the operator could not give a time frame or amount of the spill. The amount is unknown. During the inspection the reuse water was continuing to discharge off of containment to the well pad, well pad collection ditch and sediment trap.

On-site inspection conducted in response to inspection ID 2416988 for the 10/15/15 reportable release of brine water.
At time of inspection, Spartan in process of removing brine tank from earthen dike. Operator representative Richy Vrobel on-site. Per Mr. Vrobel, the brine tank was emptied yesterday and excavation of contaminated soils is to commence today.
Release appears to be localized within earthen dike. No dead and/or stressed vegetation observed outside the earthen dike. Dike is lined with plastic; however it is full of numerous holes and is shredded in some areas.
Upon removal and inspection of the brine tank, the leak was determined to be seeping from the bottom edge of the tank.
Mr. Vrobel stated that 2 inches was lost in the tank, which equates to approximately 1.5 bbl brine water. Mr. Vrobel reported that a skim of oil was observed to have been released as well. Violations are being issued for this reportable release of production fluids.
On 11/16/15, I performed an inspection of CNX GH46 well pad site. The site is located in Center Twp., Greene County. Present at time of inspection was Ken Villenna, Jason Harding, and Sam Mclaughlin (CNX). The inspection was performed as an incident response due to a spill of HCL to the access road on 11/13/15, during preparation for hydraulic fracturing operations.

A truck transporting HCL to site for hydraulic fracturing operations had a valve open which caused approx. 250 gallons of acid to spill to the access road. The operator used sodium carbonate to the neutralize the acid, and had Ryan Environmetal sampling the area for pH and SPLP. The operator will need to remediate and remove the impacted areas along the access road. The operator is continuing hydraulic fracturing operations on the site.

The operator will need to remediate and remove the impacted areas along the access road. The operator is continuing hydraulic fracturing operations on the site.

Admin review of ESX10-063-0003 (NITTANY PROJECT).

Once earth disturbance activities have ceased and final stabilization has been achieved, a Notice of Termination (NOT) form is to be completed and filed with the Department. The NOT is a regulatory requirement, as well as a standard permit condition of the ESCGP-1.

This permit was issued on 5/12/2010 and expired on 5/11/2015. To date, a request for termination of the permit has not been received by the Department.

the site.

Given the vehicle traffic, associated with current hydraulic fracturing operations, and the steep grade, the collection channels along access road were discharing sediment laden water off site. In the past discharges of sediment onto and along Jacobs Run Rd. have occurred. The operator is discharging sediment off site and into Jacobs Run a high quality watershed.

On 12/8/15, I performed an inspection of CNX Morris Spur pipeline site. The site is located in Morris Twp., Greene County. On site during inspection was Andy Kinter (CNX). The inspection was performed as a routine inspection of the site, because of a request by the operator for a termination of the ESCGP permit for the site.

The operator constructed an access road and valve setting with stoned pad without modification of the permit. The operator constructed the pipeline outside the approved LOD in two locations.

The site has been stabilized and is vegetated with greater than 70% vegetated cover. The E&S controls have been removed except a small section of silt fence along a stream crossing and road crossing which the operator will need to remove. The ESCGP permit is denied for termination, until the operator addresses the issue of construction outside the LOD.

On 2/11/2016, I performed an inspection of CNX GH46 well pad site. On site during the inspection was Jarret Jones (CNX). The site is located in Center Twp., Greene County. The inspection was performed as an inspection of the site because of a reported flow back water spill on site by the operator.

The operator reported a spill of approx. 50 bbls of flow back water spilled to containment with 2 bbls to the well pad. During flow back operations a fill line to a 500 bbl frac tank became disconnected and the line leaked the flow back water to the secondary containment. The operator noted mud outside the containment during freezing conditions which indicate that the secondary containment was damaged and the flow back water leaked to the well pad. The location of the spill was also the location of a previous spill on the site during hydraulic fracturing operations on 7/30/15. An area approximately 40' x 100' appeared to be impacted by the discharge.
On 2/11/2016, I performed an inspection of CNX GH46 well pad site. On site during the inspection was Jarret Jones (CNX). The site is located in Center Twp., Greene County. The inspection was performed as an inspection of the site because of a reported flow back water spill on site by the operator.

At time of inspection brine tank located in earthen dike. Valve at bottom of tank appears attached. No liner in dike observed; some fluids present in dike.
It appears excavation of contaminated soils has not yet begun because of inclement weather. Operator anticipates beginning excavation on 2-17-16. Department recommends Operator install temporary BMP's prior to beginning earth moving activities to prevent a subsequent potential pollution event.
Site and access road snow covered.

Violation being issued for discharge of brine or other fluids on or into the ground.

On 12/29/15, I performed an incident response inspection at GH46 site in response to an operator reported spill and made the following observations:
•The initial report on 12/29/15 indicated that 25 barrels of flow back material had been released to containment with “some leaked off containment.”
•At the time of inspection containment on site held significant amounts of reddish water with multiple areas showing an oily sheen. Off containment the site of the spill was largely covered in thin mud with some puddles of reddish water that leaked out of/through the containment. This constitutes a violation of 25 Pa. Code § 78.57(a) in that the operator discharged fluids onto the ground and 58 Pa. C.S. § 3218.2(a) in that the operator’s containment system did not contain the spilled material.
Conclusion:
• A site characterization report should be completed for the site within 180 days of the date of the spill. Immediate remediation to prevent the spill from spreading and impacting groundwater is strongly recommended.
--> More details in full report.

Notification of a brine release at the GH 4 well site in Center Township, Greene County was received on Wednesday April 20, 2016. An estimated 20 to 30 gallons of brine was released from a leaking ball valve for an unknown time period. Upon Department inspection, three separate areas of discolored soil were identified. The areas were tested by CNX and exhibited high conductivity readings. No discernable pathway between the three locations was apparent. CNX attributed the two additional areas to past events. The three areas were excavated and soils were carted off-site for disposal. Violations of 35 P.S. § 691.401 and 25 Pa. Code § 91.34(a) were cited.

On Monday May 16, 2016 the original NOV dated April 27, 2016 for the brine spill at the Greene Hill GH 4 Well was revised with more appropriate citations. Waters of the Commonwealth were not impacted therefore the Clean Streams Law 35 P.S. § 691.401 was not violated and 35 P.S. § 691.301 is being cited due to the impact to the ground surface. Title 25 Pa. Code § 78.54 is being substituted for Title 25 Pa. Code § 91.34(a) because it is the more appropriate citation.

Upon investigation of Inactive Status and Inspection on site,this well appears to be "Abandoned" since 2013. No production reported to Pa. DEP Oil & GAS Reporting System since 2013.
Upon investigation of Inactive Status and Inspection on site,this well appears to be "Abandoned" since 2013. No production reported to Pa. DEP Oil & GAS Reporting System since 2013.
On 5/3/2016, I performed an inspection of CNX GH3 well pad site. On site during the inspection was Jessie Valentine (CNX). The site is located in Center Twp., Greene County. The inspection was performed as an inspection of the site because of a reported production water spill on site by the operator.

The operator reported a spill of approx. 1.5 bbls of production water spilled to the ground, because of a valve failure on the water collection line. The operator had Spartan Specialist on site to begin removing impacted soils and material for disposal.

On 5/3/2016, I performed an inspection of CNX GH53 well pad site. On site during the inspection was Kyle Borden (CNX). The site is located in Richhill Twp., Greene County. The inspection was performed as an inspection of the site because of a reported undetermined amount spill of reuse water on the site by the operator.

The operator reported a spill of undetermined amount of reuse water to the well pad. Stressed vegetation was observed by the operator on the well pad slopes at the base of a well pad drainage channel on 5/2/16. The operator recently finished drilling out hydrualic fracturing well plugs on site in preparation for flowback operations to begin. The impacted area is down gradient from the well pad in a drainage channel and at the base of the collection channel.

Release of 1 bbl production fluids and 10-12 gallons crude oil. ECB approved the Alternative Remediation report on 11/14/2016. Case Closed.
performed as a follow-up inspection of the site because of a reported undetermined amount spill of reuse water on the site by the operator.

The operator reported a spill of undetermined amount of reuse water to the well pad. Stressed vegetation was observed by the operator on the well pad slopes at the base of a well pad drainage channel on 5/2/16. The operator recently finished drilling out hydrualic fracturing well plugs on site in preparation for flowback operations to begin. The impacted area down gradient from the well pad remained. The operator has not started remediation.

The operator has continued flowback operations on the completed wells on the well pad. During the inspection stressed vegetation and water was observed on the southwest well pad slope. Using a Eutech PCSTestr 35 conductivity meter the water was determined to be flowback brine. The fluid transfer line from the onsite AST, being used for flowback water storage, to the MOR9 CI had begun to leak from a fused weld on the polypropylene line. The operator has been using the line for several days.

The operator has been using the line for several days.

tub overflowed onto containment. The produced water had left containment in at least two areas and impacted the well pad on opposite sides of the AST.
All free standing fluids were removed from the pad and the containment with a vacuum truck. Impacted materials on the well pad were excavated and taken off-site for disposal. The excavation activities were conducted with the use of soil conductivity probe readings to delineate the extent of impact and to determine the limits of excavation. Following the excavation of impacted materials from the well pad, confirmation samples were collected and new containment was installed in the affected areas. In addition, primary and secondary berms were modified to aid in preventing any similar future events.
The failure to control and contain fluids utilized in the hydraulic fracturing process is a direct violation of 25 Pa. Code § 78.54, § 78.56(a) and § 78.57(a). The failure to prevent the fluid from impacting the ground surface is a violation of 58 Pa. C.S. § 3218.2(a).

tub overflowed onto containment. The produced water had left containment in at least two areas and impacted the well pad on opposite sides of the AST.
All free standing fluids were removed from the pad and the containment with a vacuum truck. Impacted materials on the well pad were excavated and taken off-site for disposal. The excavation activities were conducted with the use of soil conductivity probe readings to delineate the extent of impact and to determine the limits of excavation. Following the excavation of impacted materials from the well pad, confirmation samples were collected and new containment was installed in the affected areas. In addition, primary and secondary berms were modified to aid in preventing any similar future events.

On Friday June 3, 2016, I received notification that a brine release had occurred at the GH 58 Well Site located in Center Township, Greene County.
A faulty O-ring seal in a hose connected to the blender failed which caused the release of brine from the line. It was estimated that approximately four barrels of brine were released due to the faulty seal. Approximately two barrels remained on containment while the remaining two barrels left containment and impacted the well pad. CNX had determined that the majority of brine that had leaked through damaged containment while a smaller portion had splashed over the berm surrounding the blender. Standing fluid on containment was vacuumed up with a truck for off-site disposal. Some excavation had commenced on the access road side of the AST where soil remediation had already been conducted as a result of an earlier release on May 26, 2016. Equipment was being moved at the time of inspection in order to complete the excavation activities and check areas under containment. CNX and their remediation contractor are completing the remediation in accordance with Act 2. Analytical result from confirmatory samples will be submitted to the Department upon receipt.

A site inspection conducted in response to a brine water spill notification provided by the operator.
A site inspection conducted in response to a brine water spill notification provided by the operator.
Incident Response Inspection conducted due to an Operator reported release of 14.5 bbl of brine.
Department spoke with Operator Rep Richie Vrobel by phone. Mr. Vrobel stated well tender was servicing well when he noticed 14.5 bbl of brine was unaccounted for. Well tender was last at site on 5-26-16 and did not notice any sign of a release. Mr. Vrobel inspected brine tank valve and nipple and did not notice any issues. Mr. Vrobel also stated brine tank was located in an earthen dike and well did not produce petroleum products. Mr. Vrobel does not believe any waterways were affected, however a stream is located approximately 100 yards down-gradient of site. Mr. Vrobel stated truck was coming to empty tank at 11:30 and Spartan was coming tomorrow to collect soil/brine tank samples and take measurements with a soil probe.
Department recommends Operator clean up impacted area according to spill policy.
At time of inspection no E&S issues observed on gated access road. Well label present and legible. Brine tank located in earthen dike appears structurally sound however plywood under tank on the western side appears wet. A follow up inspection will be conducted tomorrow to visibly inspect brine tank and area under tank.

On 6/23/2016, I performed an inspection of CNX GH53 well pad site. On site during the inspection was Jason Harding (CNX). The site is located in Richhill Twp., Greene County. The inspection was performed as a incident inspection of the site because of a reported 3 barrel spill of flow back water on the site by the operator.

The operator reported a spill of 3 barrels of flow back water to the well pad. The operator reported that during a site inspection on 6/22/16, brine stained stone and soil was noted on the well pad. The operator had Spartan Environmental personnel on site removing impacted material and collecting confirmatory soil samples to determine spill remediation effectivness.

On 6/23/2016, I performed an inspection of CNX GH53 well pad site. On site during the inspection was Jason Harding (CNX). The site is located in Richhill Twp., Greene County. An incident response was conducted as a result of an operator reported spill.
An incident response was conducted as a result of an operator reported spill.

Inspection performed in response to the above reported spill. At the time of inspection, no active leaking was observed. An area of impact, as indicated by visibly stained soil/gravel, measuring approximately 4'x4' was observed surrounding the wellhead. The spill appears to be localized to the wellhead area. No containment measures surrounding the ipacted area was observed during the inspection. Department spoke with Operator (Jason Harding) who informed Department that well has been shut in and that cleanup will commence on 9/7/2016. Department recommends Operator perform cleanup in accordance with Spill Policy and follow-up with Department upon investigation of reported concerns and to quantify release and identify all materials released if applicable within 24 hours.

Violations are being issued under 25 PA CODE 78.57. Additional violations may be forthcoming pending Departmental investigation. Department will conduct a follow-up inspection.

On 12/1/2016, I performed an inspection of CNX B16 well pad site. On site during the inspection was Jason Harding (CNX). The site is located in Freeport Twp., Greene County. The inspection was performed as an inspection of the site because of a reported production water spill on site by the operator.

The operator reported a spill of approx. 2 bbls of production water spilled to the ground, because of a failure on the brine collection line. The operator had Wise Excavating on site to removing impacted soils and material for disposal. The operator also stated that Spartan Environmental was headed to site to characterize the site and direct remediation of the spill.

Inspection of the Hartzfeld 5 (033-26533) well in Brady Twp. Clearfield County conducted 12/27/16 at 1:45 pm. The entrance gate was locked; I walked about a quarter mile down the lease road to the well. About 60’ from the well I noticed the lease r

Rick Palmer and I inspected this site for ESCGP-1 (ESX10-059-0060) Major Modification Application. We found the drawings (plans) were different from site construction (e.g. Rock Construction Entrance, Channels, Pits, etc.) In case of GP-7 (minor road crossing) for the access road, we found several violations. There was no GP-7 permit on site and the site design was not met the conditions (e.g. Depth of fill was higher than 5 ft, the culverts was not inverted 6 inches, etc). They corrected and submitted the evidence on 12/21/2010. GP-7 was also submitted. Scott and Michelle inspected follow-up in January. See the details attached.
GP-7 was issued on 02/03/2011.

Penneco reported a diesel spill to the Pettit 11H and 10H oil well pad. Frontier Environmental is constructing the McQuay-Rutan pipeline for CONE Midstream Partners, and was staging equipment on the Penneco oil well pad. This oil well pad is outside the permitted LOD for the pipeline construction. David Harbaugh (Frontier Environmental) site foreman stated that a 500 gallon diesel fuel tank being staged on the oil well pad, had a hole in a hose, which caused an unknown amount of diesel to siphon to the ground. The tank was removed on 1/21/16. Frontier attempted to conceal the diesel spill by placing gravel over the spill, and then placing equipment trailers over the newly placed gravel. CONE has Weavertown Environmental headed to the site to begin spill remediation.

On July 16, 2012, the Department registered 2 temporary stream crossings of unnamed tributaries to Browns Creek (HQ-WWF) under DEP File No. GP08300712-025, in order to give CONSOL access to plug a well. Condition 13(a) of the Department’s General Permit No. 8 states that "Crossings may remain installed for a period of time not to exceed one (1) year from the date of the Department's acknowledgement (Item 7) unless extended in writing by the Department." No extensions were granted by the Department, therefore the GP-8's expired for these crossings on July 16, 2013.

On August 15, 2014, the Department received a letter from CONSOL stating that the project was completed, but the temporary stream crossings were left in place because the landowners wanted to keep them as agricultural crossings. This is a violation of the Chapter 105 Rules and Regulations as these crossings have now been installed for over a year without a valid permit.
On Friday, April 15, 2016, Department Biologists Michael Stephan and Dr. Will Brogan did a routine inspection of Consol Pennsylvania Coal Company’s Natural Gas Well 965 Removal and Plugging Project (GP08300715-015). During the inspection the following violations of 25 Pa Code Chapter 102 and 105 were noted.

At Temporary Stream Crossing #5, Stream 008, a pit in the stream bed was excavated during the installation of the culvert. The excavation occurred immediately upstream of the culvert and has created accelerated erosion. This crossing in the approved General Permit was for a culvert laid directly on the stream bed. Therefore the crossing was not installed as it was permitted.

At Temporary Stream Crossing #1, a culvert was installed with clean fill. The crossing in the approved General Permit was for a timber mat brige laid on top of the banks. Therefore the crossing was not installed as it was permitted

The silt fence along the stream has not been maintained. At multiple locations the fence had fallen over and was covered with sediment. At other locations the fence was ripped and was no longer keyed into the ground.

Brown’s Creek is identified in Chapter 93 as a High Quality Stream. According to 102.4(b)(6), all E&S BMP’s should be ABACT. Silt Fence is not an ABACT BMP.

It appears that tree clearing outside of the permitted Limit of Disturbance has occurred.

Erosion and Sediment Control BMPs were installed outside Limit of Disturbance.

On Friday, April 15, 2016, Department Biologists Michael Stephan and Dr. Will Brogan did a routine inspection of Consol Pennsylvania Coal Company’s Natural Gas Well 965 Removal and Plugging Project (GP08300715-015). The Department was at the above referenced Convetional Well site to conduct an inspection after being notified of a Fluid release. The Operator is currently Plugging the well on site. Operator supplied Department with details of Fluid Release. The operators details are: During plugging operations operator was pumping Mil-Gel down the backside of 8" casing trying to free the pipe. While doing so had an inadvertent return approximately 60' below the well where Mil-Gel had run into a small stream. Operator approximated a 30 barrel loss.
The operator impacted soils and waters of the Commonwealth. The operator failed to control and contain residual waste. The Pollution incident occurred at approximately 14:00 on 6/20/2013. The Operator failed to notify the Department in a timely manner.

Well site construction has encroached on wetland.
Field mtg. at site resulted in D. & L. Energy deciding not to attempt to obtain a wetland encroachment permit. They decided not to drill the well. The equipment will be moved off site and the site will be reclaimed. Refer to initial inspection record #
Violation code 601.101 general used as none exists for section 201(b), failure to notify or note water supplies < 1000'. Second violation, Chapter 78.72. No Violation code for it either. Awaiting added codes to complete record.

Company personnel responded immediately, arrange to have contents of diked area around production equipment hauled to disposal facility. Nothing reached waters of the Commonwealth.

Requested response by 5/13/05. Operator is under COA at the present time.

Today's inspection was in follow-up to my 6/15 inspection to determine if the operator had taken steps to clean-up the oil spill. Upon inspection I found that the operator had placed spill abosorbent material in the oil/water laying inside the dike. On 6/16 I contacted the production Manager Dave Rice and explained we required the stone and contaminated soil be removal and that I must inspect the soil before reinstalling the stone.

A NOV as mailed out for the violation on 6/20/11.

Well is drilled, but not equipped for production. The pit is still on-site and appears to be in sound condition. There are no E&S concerns at this time. However, the following deficiency was noted:

1- There is a special permit condition stating that tree-cutting activities can only be carried out between November 16 and March 31, due to the Indiana bat. It was evident at the time of the inspection, that trees were cleared to make the access road and well pad. These tree clearing activities would have taken place prior to November 16th.

Inspection in response to a spud notice received on 3/25/2012. At the time of inspection the drill rig was on site. Drilling was not ongoing at the time of the inspection. The Department notes that the implemented E&S controls are not adequate du

Department records indicate well was permitted on 5/18/2009 and expired on 5/1/2010. At the time of inspection, site construction appears to have commenced, as indicated by what appears to be an access road and unlined drill pit. Well not drilled and site has not yet been restored. Per current regulations if a well site is constructed and the well is not drilled, well site shall be restored within 30 days after the expiration of the well permit.

Department requests Operator follow-up with Department, in writing upon investigation of reported concerns identifying cause of violations, what Operator has done and will do to correct situation and achieve compliance and schedule/time frame of anticipated compliance activities.

Violations are being issued under 25 Pa. Code § 78.65(2) for Operators failure to restore well site within 30 days of expiration of the permit. Additional violations may be forthcoming pending Departmental investigation. Department will conduct a Department records indicate well was permitted on 5/18/2008 and expired on 5/1/2010. At the time of inspection, site construction appears to have commenced, as indicated by what appears to be an access road and unlined drill pit. Well not drilled and site has not yet been restored. Additionally, during inspection, Department observed residual waste within the drill pit. Per current regulations if a well site is constructed and the well is not drilled, well site shall be restored within 30 days after the expiration of the well permit.

Department requests Operator follow-up with Department, in writing upon investigation of reported concerns identifying cause of violations, what Operator has done and will do to correct situation and achieve compliance and schedule/time frame of anticipated compliance activities.

Well tag in place. Well is equipped for production. Access road stable.
Well site is stabilized with vegetation. No signs of accelerated erosion on road or site.

* Inspection revealed the following deficiencies:
1) Discharge of industrial waste to the ground. - An oily discharge can be seen around the perimeter of the tank. There are several areas in the soil around the tank that are dark or stained in color, and has a petroleum smell to it. There are also small puddles of an oily substance around the tank, as well as on the sides of the tank and around the inspection portal. There is also a possible discharge from the well head, as there is an area of dead vegetation starting at the well head and extending down-slope 10-15 feet.
** The silt fence should be removed from this site now that the vegetation has taken hold, and the site is stabilized

Inspection performed in response to a complaint of an ongoing leak received by the Department on 2/29/2016. Access road gated and locked. At the time of inspection well appears equipped for production. Well tag present and affixed in a permanent manner. Brine tank located on site and appears full. During inspection, Department observed two active leaking points. First active leak observed at the T-joint connector of the inflow flange located at the top of the brine tank. An approximate area measuring 4'x4' directly below the leak appears to be impacted, as indicated by visible staining of the ground/vegetation. Second active leak observed at the outflow flange located at the base of the brine tank. An approximate area measuring 2'x2' directly below the leaking outflow flange appears to be impacted, as indicated by visible dampness and pooling of fluids, with no evidence of sheen. Production chart located onsite is dated 8-20-15.

King-Maline water replacement order.
Reaming Hole; Open Mine encountered

Well appears to be in production. Brine Tank is in good condition. The following deficiency was noted:

1- The vegetation is sparse and does not reach the 70% vegetative cover criteria. Due to the proximity of the well to a Special Protection Watershed, it is essential that the vegetative cover is in place to minimize erosion and sedimentation from entering these areas. The operator should seed and mulch the site and continue to monitor for accelerated erosion and sedimentation.

JW 282, storage well in the Oakford storage reservoir (m). Dual observation well. 276 psi (f), 586 psi (m). Annulus open. Psi excedes maximun allowable psi for the Murrysville storage sand. Rich Virshup gave me documtation showing approval fro

On 2/8/2014 Dominion Trans Inc., self reported a spill of approximately 9,000 gallons of brine water that had occurred sometime the previous night at their UW#119 well site off Skyline Drive in South Union Township, Fayette County. The spill was not discovered until the morning of 2/8/14. No waterways were affected.The Department's Emergency Response, Scott Sabocheck, responded 2/8/14. Sabocheck confirmed that 220 barrels or 9,240 gallons of brine was spilled onto the ground and that soil was the only impact. Weavertown Environmental was in route to excavate the contaminated soil. Sabocheck reffered the spill incident to me.
Tank trailer vandalized and leaked brine. Operator cleaning up immediately to background-had crew work 24 hr / day.
On 4/23/2014 Dominion Trans Inc., self reported a spill of an unknown amount of brine water at their UW#107 storage well site off Skyline Drive in South Union Township, Fayette County. The spill was found by the well tender on 4/23/14, when they

No tag.
Well leaking oil on to ground from broken valve.
Leak was temp. patched.
Current operator is Deceased.
Oil has soaked into the soil approx 2.5 feet and the spill is approx.
100 ft. x 20 ft.
Production equipment consists of well head, 100 bbl. brine tank and dual phase data logger (25 psi/ 0 psi). At the time of inspection, no E&S and no gas leaks were present at the site. No well tag was present. The brine tank was heavily corroded and partially collapsed. The tank was not connected for production. The gas well appeared to be in production. Based on file review, PADEP requested production reports in 2008 from Economy. Economy submitted the reports from 2002 to 2008 to PADEP. From 2008 to present, it appears that no production reports have been submitted to the PADEP.

Spill

On 6/17/2014, I performed an inspection of Brumage and Pultorak's McClure#1 gas well. The site is located in Dunkard Twp., Greene County. The inspection was performed in response to a report of possible spill at well loction.

The well appears to have a leak in the production fluid holding tank. The soils around the tank are stained and a small pond downgradient of the holding tank is full of what appears to be production fluid and crude oil. The soils surrounding the small pond are stained and vegetation is dead at the site. Soils are stained around the well head and around the production lines on site.

Spill

On 6/17/2014, I performed an inspection of Brumage and Pultorak's McClure#1 gas well. The site is located in Dunkard Twp., Greene County. The inspection was performed in response to a report of possible spill at well loction.

The well appears to have a leak in the production fluid holding tank. The soils around the tank are stained and a small pond downgradient of the holding tank is full of what appears to be production fluid and crude oil. The soils surrounding the small pond are stained and vegetation is dead at the site. Soils are stained around the well head and around the production lines on site.

Inspected gas well near Roberts Road; Eighty Four, PA 15330.
No tag on well. Latitude 40¿ 7' 48.96" N / Longitude 80¿ 7' 7.08" W with GPS on site. Elev. 1279 ft. This well in on the DEP Orphan list.
Well is leaking from a break in a lateral section of pipe approximately 5” in diameter connected to a vertical well head approximately 5” in diameter and about 4 ½ ft. high. The well head and broken pipe are connected by a pipe approximately 2” in diameter. There is a distinct hydrocarbon smell several yards from the break in the pipe. The well is located in a wooded area. There is a significant amount of pipe, approximately 2” in diameter, connected to the well.

There is a tag on well with the number 125-01629. Latitude 40¿ 8' 2.5" N / Longitude 80¿ 7' 0.6" W with GPS on site. The well head is about 5” in diameter and stands about 6 ft. high. There is a strong hydrocarbon smell at the well head. There is a pipe about 1 ½” in diameter attached to the well. The pipe appears to be connected to a broken meter on Roberts Road. From the meter a pipe appears to go under Roberts Road. A pipe comes out from under the road across from the meter and appears to be heading to a residence.

Brine Spill aprox. 1.5 barrels.

Brine Spill off Impoundment Access Road aprox. 1.5 barrels.

Admin inspection.Department notified on 4/29 via e-mail of spill by NWRO WQS Brian Shank. Spill was reported to B.Shank by Operator representative Rusty Kraft.At 0807 on 4/30, Department contacted Mr. Kraft via phone. Per Mr. Kraft, a disconnected brine tank was on the well site waiting to be hauled away for proper disposal. At 2030 on 4/28, a resident notified Mr. Kraft of crude oil spilling out from the top of the tank. Mr. Kraft estimates of release of ¼ bbl crude oil and stated that he immediately attempted to contact Mr. Shank via phone and text message to notify him of the release.Upon notification of the release, Mr. Kraft stated that he immediately placed barriers around the release to contain the fluids and placed absorbent pads on the impacted materials. A water truck emptied the tank that night. *ADD'L COMMENTS ON PAPER SAIR*

On-site inspt conducted in response to inspection record 2368760 for the release of ¼ bbl crude oil.At time of inspt, all visibly impacted materials appear removed.Area of excavation approx 25'x40' in size and backfilled, seeded, mulched.No roll-off box on-site.BT remains on-site adjacent to AR.WT present, legible. Well head and associated equipment appears rusty.Drilling occurred 3/8/1985-3/13/1985.Faint gas odor noted.AR vegetated.Environ'l Trainee Cindy Witham present during inspt.A FUI will be conducted to ensure site is properly remediated and restored.Viols are being issued under 78.54 & 78.57(a) for this reportable release of residual fluids.Following this inspt, Dept contacted Opr rep R.Kraft via phone.Dept recommended Opr re-install E&S BMPs down-gradient of excavation and ensure any contaminants that remain on brine tank are prevented from reaching the ground in order to prevent any additional pollution events from occurring.Mr. Kraft agreed to immediately implement the Dept's recommendations.

Freeboard viol; no E &S plan; No site ID
Pollution of Howard Hunt WS (033-24794)
equipped/E&S ok/tag ok/brine disch from corroded tank
Brine discharge from leaking tank; E&S OK
Brine discharge to ground from leaking tank; E&S OK
E&S controls not implemented; pits OK
drilling complete, sed fence on access road was inadequate and/or missing or had been displaced by equipment grading road.
No stream crossing permit.

Dishc. of (IW) to ground... blowing well brine & oil to hillside, bench equipment, gravel walking surface, etc..

Old well. Still producing gas. Tank has been removed and dead zone extends down gradient from tank pad. Starting to erode. Tag poor.
Old well. Still producing gas. Tank has been removed and dead zone extends down gradient from tank pad. Starting to erode. Tag poor.

CEI - original spill addressed - new spill discovered from frac tanks

1) Failure to minimize accelerated erosion- Fill side of pad was not stabilized, recent heavy rains caused erosion to such an extent that primary sediment fence was failing
2) A secondary sedimenr fence was in place, but installed improperly allowing runoff to flow through it freely. Runoff followed the road around a small curve and downhill where it discharged into Little Trout Run.
3) Freeboard in pit fell below 2ft.
Note: Sited was visited on 4/2/2009 as well, similar violations were found. Also present during this visit were Curtis Small, Rick Hoover and Bruce Jankura.

3) Freeboard in pit fell below 2ft.
Note: Sited was visited on 4/2/2009 as well, similar violations were found. Also present during this visit were Curtis Small, Rick Hoover and Bruce Jankura.
The following BMPs had been installed since inspection on 4/3/2009:
1) A third row of sediment fence was installed along the road at the bottom of the hill and anywhere that showed previous avenues of water flow from the well pad. Hay blaes lined both sides of the fence and were staked in place.
2)Areas where sediments accumulated were heavily mulched
3) One channel crossing lower road was lined with large stone
Note: stream is visibly clearer where sediments were discharging into it
Deficiencies:
1) accelerated erosion on fill side not stabilized
2) Freeboard still not below 2ft

NOV sent to company
The Department met on site with Seth Barnette from Eastern American Energy Corp. The Operator was in the process of building a marcellus well pad. The Department observed E/S violations on site. The operator did not have any E/S controls o
The Department met on site with Seth Barnette from Eastern American Energy Corp. The Operator was in the process of building a marcellus well pad. The Department observed E/S violations on site. The operator did not have any E/S controls o

Site contains multiple areas where channels are beginning to cut through slopes, both on pad and from access road. Seed and mulch are in place, but vegetation is sparse. BMPs are starting to be overrun with sediments

Water sample was taken on 8/25/09 from artesian flow of fluids from 8 5/8" surface casing hanger./ Administrative review of sample results revealed the following:/ 1) Discharge of industrial waste to the ground./ Sample results report the discharged

contractor was on site and had excavated a ditch across the entire pad to drain the surface water that was building up on the back of the pad. The water being discharged was causing accelerated E/S. The E/S controls were over overwhelmed when all the water was directed to one area. The muddy water was flowing over the silt fence and directly into a tributary down gradient. The cut side of the well pad is extremely unstable and multiple slides have occurred causing the soil to reach the drilling pit which does contain flow back water and other drilling compounds..

the operaotre was cited under this NOV for the following 3 reasons:
1. Operator placed a temporary road crossing without 105 permit.
2. No RCE installed per the ESCGP.
3. Diesel additive containers and oily substances found on ground.

In addition, two ongoing pollution events (sediment netering stream) during visit. These violations will be dealt with through a seperate inspection performed by Ben Dille.

On 1/14/2014, I performed an inspection of ECA's Broadwater well pad site. The site is located in Jefferson Twp., Greene County. The inspection was performed because of a citizen complaint of muddy water in Eaton Run.

Eaton Run a tributary to Muddy Creek was noted cloudy at the confluence with Muddy Creek. Upon inspection of the well pad construction site. Sediment had overwhelmed the E&S controls and was discharging into Eaton Run.

Operator was on site repairing the E&S controls and addressing issues of accelerated erosion on site.

On 9/4/15, I inspected the Skib A and B Pads with DEP Engineer Dr. Tae-Uk Kim and DEP Biologist Samantha Sullivan and made the following observations:
•Multiple areas of disturbance and construction outside of LOD including:
-A large area of access road leading to the southern pad built…
-Substantial areas around both pads were cleared and contoured.
-This is a violation of 25 Pa. Code § 102.5(c) and 102.5 (m)(4)…
•Large areas of undelineated wetlands were found in proximity to the site along the bed of the stream on site. This is a violation of 102.4(b)(5)(v)…
• A poorly constructed and unmaintained sediment trap has created a small wetland patch on the slope below the impoundment. This is a violation of 25 Pa. Code § 102.5(m)(4)…
•The impoundment is purportedly being used as a freshwater impoundment though originally permitted and potentially used as a frack water impoundment.
•A non-permitted access road has been cleared and stabilized leading to an adjacent pipeline. This is a violation of 102.5(c) and (m)(4)-->Further details in full report.

On 01/07/16 at approximately 0830 hours I conducted an administrative inspection in response to a request for restoration extension submitted by ECA.

Drilling activities for the last well (#3) were completed on 10/25/2013 according to Department records. The 9 month date for restoration was 07/25/2014. The request for restoration extension was received on 10/09/2015. A violation of Section 3216(c) of Chapter 32 of Act 13 has occurred for failure to restore the site within 9 months of completion of drilling a well.

The extension request is being denied.

On 01/07/16 at approximately 0830 hours I conducted an administrative inspection in response to a request for restoration extension submitted by ECA.

Drilling activities for the last well (#2) were completed on 12/10/13 according to Department records. The 9 month date for restoration was 09/10/2014. The request for restoration extension was received on 10/09/2015. A violation of Section 3216(c) of Chapter 32 of Act 13 has occurred for failure to restore the site within 9 months of completion of drilling a well.

The extension request is being denied.

On 01/07/16 at approximately 0830 hours I conducted an administrative review of the Pechin well Pad in response to a request for restoration extension submitted by ECA. The ESCGP was allowed to expire on 11/01/15.

The following violation has resulted

25 Pa. Code § 102.5(m)(4)

On 01/29/16 at approximately 0700 hours I conducted an administrative inspection in response to a request for restoration extension submitted by ECA.

Drilling activities for the last well (#2 & #4) were completed on 12/20/2011 according to Department records. The 9 month date for restoration was 09/20/2012. The request for restoration extension was received on 11/18/2015. A violation of Section 3216(c) of Chapter 32 of Act 13 has occurred for failure to restore the site within 9 months of completion of drilling a well. A violation of 102.5(m)(4) has occurred for the permit being allowed to expire.

The extension request is being denied.

On 01/29/16 at approximately 0700 hours I conducted an administrative inspection in response to a request for restoration extension submitted by ECA.

Admin review inspection record for NOV issued 9/12/2014 (Springfield Twp, Bradford Co GMI - Kingsley 2H, Kingsley 3H, Kingsley 4H, Gross 1H).

On 7/10/15, I inspected the Io Compressor Station site in response to a spill report from the operator and made the following observations:
•The operator reported that a serious rain event overwhelmed E&S controls near the site entrance and an unknown amount of storm water and sediment entered the stream.
•At the time of inspection there was no indication of any adverse impact to the stream with no apparent increase in sediment downstream of the site.
-This release does constitute a violation as the operator failed to implement the earth disturbance in a manner that minimized the generation of increased stormwater runoff.
-Due to timely reporting, historically high rainfall, and increased efforts to mitigate storm water issues this event is being noted as immediately corrected at this time.

Erosion & sediment from a water the McNay withdrawal operation supporting EQT's Marcellus operations. Significant E&S issues. The site does not have a permit and the violation was site against the Client ID and the OGO number.
Shippen Twp, Cameron Cnty, CSL 401 sediment discharge. Followup inspection IR 2258131 closed violations.

Site ID Sign and E/S plan are posted at the end of the access road.
Drilling is completed, and the well is shut in.
Cellar is filled with water with a layer of ice on the top.
Well head is leaking from somewhere below the surface of the water. Gas is bubbling up through the water all around the wellhead. There was no discernable smell of natural gas, but the gas could be heard bubbling.
Pictures and a video were taken of the well head leak.
A spill was noted between the well head and the pit.
This spill appears to either be drill cuttings, or drilling mud.
Spill will be turned over to WQS Sam Jones.

Approximate 10,000 gallon flowback spill

On 1/14/2014, I performed an inspection of EQT Sanders well pad site. The site is located in Washington Twp., Greene County. The inspection was performed as a routine inspection.

Craigs Run an unnamed trib. to Ten Mile Creek was noted grey in color at the confluence with Ten Mile Creek. Upon inspection of the access road, the limestone stone added to the access road was liquifing because of recent precipitation and heavy truck traffic and overwhelming the E&S controls and discharging into Craigs Run.

Operator was on site cleaning the township road and cleaning the sediment trap at the start of the access road to prevent futher discharge of the material off site.

On 1/14/2014, I performed an inspection of EQT Sanders well pad site. The site is located in Washington Twp., Greene County. The inspection was performed as a routine inspection.

Operator was on site cleaning the township road and cleaning the sediment trap at the start of the access road to prevent futher discharge of the material off site.

On 1/27/2014, I performed an inspection of EQT A.Rose/Robison well pad site. The site is located in Morgan Twp., Greene County. The inspection was performed because of reported spill on 1/22/2014.

On 1/22/14 the operator reported a spill of approx. 10 barrels of production fluid from a broken burried water line. The fluid migrated off the well pad and down the fill slope of the well pad. The operator removed visibly impacted soil and sampled the soils to ensure that all impacted material was cleaned up. Operator is storing impacted material on site in three dumpsters in containment.

Site overrun during torrential rainstorm and did not report it to DEP. Citizen complained to EQS official and it was not reported to the Department.

The operator informed the department on 8/25/2014 that after a rainfall event on 8/20/2014 the BMPs failed and sediment entered ST40563 an unnamed trib. to Browns Creek. The sediment also impacted the neighboring farm pond near the headwaters of ST40563.

Operator was on site cleaning at the neighboring farm pond removing wood chips and sediment by hand from the recharge area of the pond. Operator is in process of preparing documentation to apply for an emergency 105 permit to access the stream channel for cleanup of sediment in the stream and pond.

The operator informed the department on 8/25/2014 that after a rainfall event on 8/20/2014 the BMPs failed and sediment entered ST40563 an unnamed trib. to Browns Creek. The sediment also impacted the neighboring farm pond near the headwaters of ST40563.

Operator was on site cleaning at the neighboring farm pond removing wood chips and sediment by hand from the recharge area of the pond. Operator is in process of preparing documentation to apply for an emergency 105 permit to access the stream channel for cleanup of sediment in the stream and pond.

EQT was operating the site while the stream was in a passby flow condition, which means that withdrawls should not be occurring. I notified the representative at the site, and hte pumping was shut down.

Administrative review of lab analysis from samples collected on 11/25/14 from standing water on the pad surface following drilling operations. The completed results show exceedances of Department standards for several parameters indicative of w

On 2/9/2015, I performed an inspection of EQT J.Moninger well site. The site is located in Morris Twp., Greene County. The inspection was performed because of a spill of water based drill mud of site and into a wetland.

The operator was storing and circulating water and oil based drill mud on the well site. During circulation of water based drill mud, a 500 barrel frack tank overflowed, causing the secondary containment to fail. The drill mud ran over the well pad berm and discharged off site into a wetland near the location. The operator notified the Department approx. 12 hours after the spill was observed on location.

JRC representatives on site began removal of visually impacted material from the well pad slope after the spill, and placed mulch over these areas.

less than 5 gallons of limestone gravel was washed into a nearby stream after a heavy rainfall event. Stormwater from the J&J well pad access road collects and runs down the roadside ditch, through a 30" crossdrain to a rock filter. Just downgradient of the rock filter is a historic 16" culvert pipe located on private property which drains into a channel that extends ~50' until it dissipates. There is ~30' flat, vegetated area between this channel and an UNT to Ruff Creek which was disturbed during this run-off incident. A small amount of gravel was observed to have been deposited into the UNT to Ruff Creek, this is a violation of the Clean Streams Law.

On 7/6/15, administrative review of the EQT gathering line NIJUS015 by Environmental Group Manager Daniel Counahan found the following:
•The ESCGP expired on 01/08/15 which constitutes a failure to adhere to the terms and conditions of their ESCGP by letting their permit expire without terminating the permit.
•A gravel pad, not included in the permit or approved as part of the plans for the site, was constructed in a wetland on the site. This constitutes a violation in that the operator placed fill within a wetland and floodway of a stream without a permit and failed to adhere to the terms and conditions of their ESCGP by installing a gravel pad not approved in their plans.
Summary of violations:
•105.11 placing fill within a wetland and floodway of a stream without a permit
•78.53 and 102.5(m)(4) for failure to adhere to the terms and conditions of the ESCGP by installing a gravel pad not approved in the plans.
•78.53, 102.5(m)(4) and 102.7(a) for failure to adhere to the terms and conditions of the ESCGP by allowing the permit to expire...

On 8/6/15, I performed a follow up inspection on the Alpha 1 site meeting with EQT representative Corey Giles to gather further information about a production fluid spill that occurred and was reported on 7/27/15:
•The spill was not in the area suspected at the time of the first inspection, it occurred around a single green tank near the pad entrance.
•At the time of the second inspection an EQT crew was performing soil testing.
•Corey Giles indicated at the time of inspection that he did not believe that spill was as large as the initial estimates he provided (revised estimate of “less than 80 gallons”). Observation of the cleanup area was inconclusive but the containment around the tank in question did not appear to be large enough to hold the original estimated amount.
-->Further details in full report.
On 8/6/15, I performed a follow up inspection on the Alpha 1 site meeting with EQT representative Corey Giles to gather further information about a production fluid spill that occurred and was reported on 7/27/15:

On 8/27/2015, I performed an inspection of EQT J&J well pad site w/ John Carson, Dan Counahan and Charley Yang (DEP). Also on site was Bill Balog, Todd Klaner, Rex Nelson, Rodney Moyers, and Dave Crayne (EQT). The site is located in Washington Twp., Greene County. The inspection was performed as a routine inspection related to run off issues at site.

During recent rainfall events at site. Sediment has left the site LOD entered a stream channel, an unnamed trib. to Ruff Creek, down gradient from the site and impacted a farm pond along the stream. Concerns arose during the inspection and site meeting on compliance of the site's construction to the approved plans. The operator has made improvements to the existing road to access the permited site entrance. The operator will need to submit an emergency permit for additional streambank cleanout and pond sediment removal. The operator has agreed to complete a as-built vs. permitted site plan.
Inspection performed as result of a operator reported spill of production fluids (brine) at the Wright Multi-Well Pad. According to information provided to the Department by the operator the spill ocurred on 09/25/15. According to the report from the c
Inspection performed as result of a operator reported spill of production fluids (brine) at the Wright Multi-Well Pad. According to information provided to the Department by the operator the spill ocurred on 09/25/15. According to the report from the c
On 9/25/15, I inspected SITE in response to an inadvertent return reported by the operator and made the following observations:
• Initial reports specified a bentonite spill of unknown quantity with no affect to waterways.
• Inspection revealed that a large amount of bentonite drilling mud with minor black, oily contamination had broken through in an operator delineated wetlands area including an area of wetlands outside the project LOD.
• At the time of inspection the operator had removed most of the released material without any additional permits for working in the wetland. No further estimate of material lost was provided.
• A nearby stream did not appear to be affected by the return, live fish and aquatic organisms were observed.
• Access to site was fairly difficult due to steep grade of access road approaching stream.

On 9/25/15, I inspected SITE in response to an inadvertent return reported by the operator and made the following observations:
• Initial reports specified a bentonite spill of unknown quantity with no affect to waterways.
• Inspection revealed that a large amount of bentonite drilling mud with minor black, oily contamination had broken through in an operator delineated wetlands area including an area of wetlands outside the project LOD.

• A nearby stream did not appear to be affected by the return, live fish and aquatic organisms were observed.
• Access to site was fairly difficult due to steep grade of access road approaching stream.

On 10/2/2015, I performed an inspection of EQT Harden Farms Well Connect pipeline and TWL. The site is located in Morris Twp., Greene County. Present at time of inspection was Greg Mankey (EQT). The inspection was performed because of a Inadvertent Return (IR) of drill cuttings, and soap into Hopkins Run from an HDD bore beneath ST29618 an Unnamed trib. to Browns Creek and Hopkins Run Rd.

The operator had Proshot Directional Boring completing the HDD bore and a IR was noticed in ST29618 on 10/1/15. The operator reported the IR to the department 24 hours later. The operator had setup a pump around in the stream channel to divert the water around the impacted area. Approx. 150' of the stream channel was impacted by the IR. ST29618 is a high quality water shed, but had minimal flow in the stream. I met w/ Mr. Mankey, construction foreman for EQT on site and discussed remediation of the impacts to the stream channel. The operator will need to remove the drilling mud from the stream channel and remdiate the impacts

On 11/9/2015, I performed an inspection of the EQT Gallagher well site. The site is located in Amwell Twp., Washington County. The inspection was performed because of a spill of production fluid off site and into an unnamed tributary to Ten Mile Creek.

On 11/6/15, during transport of production fluid from the site to a disposal facility, the truck transporting the fluid was involved in a vehicle accident causing the truck's tank to fail and spill approx. 40 barrels of production fluid to the access road, which discharged into ST40866 an unnamed trib. to Ten Mile Creek. Noted fish kill was associated with the discharge into the stream. The stream was at low flow conditions with intermittent flow.

Noted fish kill was associated with the discharge into the stream. The stream was at low flow conditions with intermittent flow.
On 11/9/2015, I performed an inspection of the EQT Gallagher well site. The site is located in Amwell Twp., Washington County. The inspection was performed because of a spill of production fluid off site and into an unnamed tributary to Ten Mile Creek.

On 11/6/15, during transport of production fluid from the site to a disposal facility, the truck transporting the fluid was involved in a vehicle accident causing the truck's tank to fail and spill approx. 40 barrels of production fluid to the access road, which discharged into ST40866 an unnamed trib. to Ten Mile Creek. Noted fish kill was associated with the discharge into the stream. The stream was at low flow conditions with intermittent flow.

Noted fish kill was associated with the discharge into the stream. The stream was at low flow conditions with intermittent flow.

On 1/27/2016, I performed an inspection of EQT Big Sky well pad site. The site is located in Washington Twp., Greene County. The inspection was performed as a routine inspection of the site.

Given the vehicle traffic, associated with current hydraulic fracturing operations, and the steep grade, the access road was discharing sediment laden water off site into Ruff Creek. Limestone sludge is also being discharged off site onto State Route 221 at the entrance to the access road. The access road has rock construction entrance to prevent sediment leaving the site at the entrance to the access road from State Route 221.

On 03/14/16 at approximately 1330 hours I conducted an incident response inspection in response to a spill from 03/12/16 at the EQT White pad.

On 03/12/16 at 0305 hours a brine spill occurred to the well pad surface off containment when a truck was loading and the sight glass broke. Initial estimate by the truck driver was 3-5 barrels of fluid, but EQT revised the estimate to 30-40 gallons once EQT staff were able to evaluate the spill. A vacuum truck removed standing fluid and excavation occurred at first light on 03/12/16. An area approximately 30’30’x6” was delineated with the use of a soil conductivity probe and excavated. The impacted material was placed in a lined roll off box for disposal.

The impacted material was placed in a lined roll off box for disposal.

At the time of inspection, well tag was present. Production equipment was removed. Based on file review, inactive status was never filed for the site. No production reports have been submitted to DEP since 2008. No mechanical integrity reports ha

On 07/26/16 at approximately 1330 hours I conducted an incident response inspection at the EQT Hildebrand well pad in response to a BMP blowout at the site. The Act 9 sign was in place and all required documents were present.

The site was being restored at the time of the BMP failure. A large rainfall event had occurred, overwhelming the sediment trap and causing the downslope wall of the sediment trap to fail. The resulting water, rock, and sediment broke through multiple silt socks leaving the LOD and entering a stream. A large amount of rock and gravel was found in the stream bed approximately 150’ from the sediment trap failure (see photographs). A pond approximately 200-250’ downstream was discolored from the sediment released from the BMP failure. At the time of inspection an excavator was repairing the breach in the sediment trap wall. EQT was advised to apply for an emergency 105 permit to repair the section of the stream that was impacted by the BMP failure.

The following violations resulted from the BMP failure.

matched the site as constructed. According to Department records, this plan was not approved, nor were the changes made to the site.

Multiple violations of 102.5(m)(4) 102.5(c) were observed at the time of inspection and are listed below:

-The road to the south of the well pad was not constructed in the approved location
-The gravel area to the south of the well pad was not constructed as approved and an increase in impervious area has resulted.
-The location approved as an impoundment was constructed as an AST pad and is a significant increase in impervious area.

The area between the well pad, gravel pad to the south, and the location that was approved as an impoundment contained a large volume of water. The constructed features in this area are effectively working as a dam and causing flooding. This is a violation of 78.53 and 102.11(a)(1).

The increase of water in this location has affected the wetlands found on site. This is a violation of 105.11. It is recommended that a permit be obtained or the wetlands restored to previous conditions.

It is requested that an updated as-built plan be submitted to the Department.

It is recommended that the increased gravel areas be removed and restored to approved conditions or a major modification be submitting including PCSM.

matched the site as constructed. According to Department records, this plan was not approved, nor were the changes made to the site.

•On 9/6/16 EQT Corey Giles reported a spill of 100 gallons of produced fluids to the well pad. The spill was forwarded to the WQS on 9/14/16. This constitutes a violation of 25 Pa. Code § 78.57(a) and 25 Pa. Code § 78.54 for failing to control brine and other fluids resulting in discharge to the ground and failure to prevent pollution to the Waters of the Commonwealth.
•The spill was cleaned up at the time of inspection with the only observed indicator of the spill location being an area of new gravel on the pad near the production units. No violation.
•Well drilling was ongoing at the time of inspection.
•During general pad inspection it was noted that multiple production tanks had orange streaking running down their sides from the top of the tanks. The gravel of the pad surface near the containment displayed matching orange staining with a distinct edge corresponding with the edge of the containment strongly indicating that produced fluids had at some point been released from the overflow pipes of the production tanks and had either sprayed or been blown out over the top of the tank containment onto the pad. No violation, remediation strongly recommended.
•Significant construction activities were ongoing at adjacent Smith to M3 pipeline project. No violation.

Routine/complete inspection.
Routine/complete inspection.
On December 16, 2016 I performed a follow up inspection at the Howard Haywood site in response to concerns noted in a previous inspection (ID: 2549486) of the site on 12/6/16 and made the following observations:
•On 12/6/16 multiple issues with containment and minor spills were noted to site personnel and immediately remediated.
•Near the junction of the site access road and the pad a large metal plate had been placed so that it was crushing and compromising the containment around multiple pallets of chemicals marked “AES Drilling Fluids”. Multiple other empty chemical storage containers were also found without any containment. This is a violation of 58 Pa. C.S. § 3218.2(d) for failing to provide containment with at least 110% capacity on regulated substances.
•A spill of more than ten gallons of antifreeze was found off of containment near the drill rig. The situation was immediately communicated to site personnel for remediation. This constitutes a violation of 25 Pa. Code § 78.57(a) and 25 Pa. Code § 78.54 in that the operator failed to control and prevent the discharge of production fluids to the ground.
On December 16, 2016 I performed a follow up inspection at the Howard Haywood site in response to concerns noted in a previous inspection (ID: 2549486) of the site on 12/6/16 and made the following observations:

•On 12/6/16 multiple issues with containment and minor spills were noted to site personnel and immediately remediated.
•Near the junction of the site access road and the pad a large metal plate had been placed so that it was crushing and compromising the containment around multiple pallets of chemicals marked “AES Drilling Fluids”. Multiple other empty chemical storage containers were also found without any containment. This is a violation of 58 Pa. C.S. § 3218.2(d) for failing to provide containment with at least 110% capacity on regulated substances.
•A spill of more than ten gallons of antifreeze was found off of containment near the drill rig. The situation was immediately communicated to site personnel for remediation. This constitutes a violation of 25 Pa. Code § 78.57(a) and 25 Pa. Code § 78.54 in that the operator failed to control and prevent the discharge of production fluids to the ground.

site constructed, well was not drilled, site req. restoration
Well is tagged, shut in and not equipped for production. Well head casing looked ok. A check with efacts disclosed that this well had no production reported in the previous year of 2015.

Drilling was completed on 11/15/2003. Site has been restored. Brine tank is in sound condition. The access road is on a very steep slope with no BMP's to control erosion and sedimentation. As a result sedimentation has occurred in a tributary of Be
Inspection conducted with Vince Yantko, Ed Ritzer, Nick Stafieri, and Brian Dillemuth from DEP, as well as Steve Kepler and Matt Sodmont from PA Fish and Boat Commission.
Well tag in place. Well is equipped for production. Pump jack installed. Tank appeared sound.
Access road stabilized, with no signs of accelerated erosion.
Site is stabilized, with no signs of accelerated erosion on site. Inspection revealed the following deficiencies: 1) Discharge of industrial waste in the form of brine to waters of the Commonwealth. There is evidence of a brine release from this well which directly entered waters of the Commonwealth (a drainage swale adjacent to the well, and associated wetlands). The soil and rock around the well head shows staining from a release of fluids. This stain can be seen in a 4 to 5 foot radius around the well head. A water sample taken from the drainage swale adjacent to the gas well was taken. Results of this sample were consistent with the analysis of brine.

Adequate company response rec'vd 5/13/2010, past viol closed.

#NAME?

Reported Brine spill approx. 20 bbls. cleaned up.

Inspection in response to incident notification filed on 08/20/10 at 16:10 reporting a release of approximately 19 barrels of brine from what appeared to be a slow leaking valve seal on brine tank. Met with EXCO EHS coordinators onsite, it was determined brine tank was emptied, valve seal was repaired and appeared leak had been controlled. Exco began coordinating efforts to remove brine tank and excavate and properly dispose of contaminated soil surrounding the brine tank. Department instructed operator to have samples taken of contaminated soil as well as a background sample to determine extent and depth of contamination in relation to undisturbed soils. Operator will continue to contact dept with updates on soil sample analysis results and progression of final remediation. Violations will be issued for the reportable release, but at this time the release is secured and operator is actively addressing the violation. No other violations noted at this time.
Accompanied by WQS Dana Burk for training purposes.

On-site follow-up inspt in response to admin inspt 2243922 for reported spill on 2/5/2014 of 35 gallons production water to ground.

At time of inspection, previously producing well currently being (re) frac'd. Operator representative Tom Livingston on-site.

Per Mr. Livingston, while plowing snow, skid-steer sliced open base of disconnected brine tank. The brine tank was removed from previously producing well prior to reported incident.

Contaminated soils wrapped within liner awaiting placement into roll-off box. All visibly impacted soils appear removed. Conductivity meter then utilized to ensure all impacted soils removed.

Department requests all disposal records and manifests upon final disposition of wastes.

No adverse environmental impacts observed at this time. A follow-up inspection will be conducted in the future to ensure area of contamination has been properly cleaned-up and restored.

Violations are being issued for this reportable release of production fluids under 25 PA CODE 78.54 and 78.57A.

impact visually and with aid of conductivity meter. Mr. Livingston states remedial actions to be conducted by removing all visually impacted soils and utilizing a conductivity meter as guidance. Department recommended that remedial efforts include either the utilization of Act 2 or sampling under the Alternative Remediation option, as outlined in the current spill policy.Violations are being issued for this reportable release of residual fluids under 25 PA CODE 78.54, 78.57A, 91.34.
As per the current spill policy, Department requested written notification of remedial action plan within 15 days. Department also requested an e-mail documenting the events surrounding the release.UPDATE: At 1503, e-mail documenting events, as requested above, received from Mr. Livingston.

On-site inspt as follow-up to admin inspt 2270692 for the release of 30 gallons oil from production tank.

At time of inspection, all visibly impacted soils appear removed. Excavated soils wrapped in tarp. Absorbent pads in base of excavated area, appear "clean".

Disconnected brine tank on-site. Well tag present. According to records, drilling occurred 3/14/1984-3/22/1984.

Department recommends Operator maintain access road in order to prevent any potential accelerated E&S events from occurring and continue to monitor and maintain well site.

Violations are being issued for this reportable release of residual fluids.

E-mail documenting events surrounding this release previously requested.

At this time, the Department is requesting the Operator submit all disposal records and manifests upon final disposition of wastes to the attention of Samantha Foulk at the above listed address.

Admin inspt in response to e-mail submitted to Department on June 2, 2014 by Operator representative G. Shawn Meenihan.

E-mail provides notification of possible diminution of a private water supply reported to Operator by landowner. Per the e-mail, sampling was previously conducted May 6, 2014 by the Operator in response to this complaint; hence, Operator did not notify the Department of this complaint within 24 hours of receiving this notice.

Department contacted Mr. Meenihan via phone to inquire about the exact date that this complaint was received by the Operator. Mr. Meenihan stated that the Operator was notified of the potential diminution in "early April". Mr. Meenihan agreed to locate the exact date this notice was initially received and provide to the Department.

Violations are being issued under 25 PA CODE 78.51(h).

A discharge of production fluids was discovered at approaximately 9AM on 07/01/14. EXCO began interim remedial actions which included removal of the remaining fluid from the tank and outlining the affected soil and media for excavation. The di

On-site inspection as follow-up to admin inspection 2300549 for the 9/2 reportable release of 4.5 bbl brine water into earthen dike.

At time of inspection, contaminated soils excavated into three piles and wrapped in liners awaiting proper disposal. Area of excavation surrounded by orange security fence.

Adjacent to ag field. Access road stable. No accelerated erosion or sedimentation issues observed in relation to access road or well site.

According to records, drilling occurred 11/21/2008-11/26/2008. Well label present.

Department recommends Operator continue to monitor and maintain site throughout remediation efforts as necessary.

A follow-up inspection will be conducted in the future to ensure site is properly cleaned-up and restored.

Violations are being issued for this reportable release of production fluids.

At this time, the Department is requesting the Operator submit all disposal records and manifests upon final disposition of wastes to the attention of Samantha Foulk at the above listed address.
covered with plastic.Ground and remaining production equipment charred.Immediate perimeters of charred areas surrounded by discolored/stressed vegetation.Stressed vegetation does not appear to extend down nearby hillside, appears localized to well site.
Excavation of contaminated materials to commence after removal of damaged production equipment from site. Department recommends Operator install E&S BMPs down-gradient of site prior to the commencement of any earth disturbance activities in order to prevent a subsequent potential pollution event from occurring. Violations are being issued for this reportable release of production fluids.
Additional comments on paper copy

Met onsite with EXCO representative Ron Jenkins. A discharge of production fluids was discovered by EXCO personnel on 11/25/14 and reported to the SWRO at approximately 12PM. At that time EXCO representative Ron Jenkins contacted WQS Higgins regarding the spill and arranged an onsite meeting for 11/26/14 at 8AM. Mr. Jenkins detailed that approxmiately 10 barrels of production fluid, brine no oil, had been dischargeed to the ground beneath the tank. The volume was arrived at through tank levels obtained during a previous visit by the well tender in comparison to 11/25/14. Preliminarly EXCO has shut the well in and is removing the remaining fluids from the brine tank located onsite.

Site inspection of the affected area finds that the conditions agree with what was reported and it shows that the affected area is localized and around and beneath the tank. The affected area will be delineated, excavated, stored onsite until disposal is approved and confirmatory and background samples will be obtained.

At time of insp,tag present/legible.BT appears sound.Site appears stabilized.Dept obs'ed area of dead/no veg that may be indicative of brine release. Dept collected soil samples;1 background,3 of potentially impacted soils.Dept spoke to EXCO on 4

Approx 15 gallons cellar water escaped containment. Affect pad area was excavated.
Well was spudded on 7/16/2008 and never completed; has been idle since.

The well had two annular vents. They were not labeled and both were 2”diameter. The vents were later identified by EXCO following the inspection. The 9-5/8” x 5-1/2” vent pipe had a 0-5000 psi analog gauge in place and the vent was shut-in. Venting of gas was observed when the vent was opened. The 13-3/8” x 9-5/8” annulus vent was open at the time of the inspection. Both vents were monitored with an Altair 5X gas meter calibrated on 12/28/15.
13-3/8” x 9-5/8” – 20% methane, Sample ID: 2371-G-12312015-01, Collected at: 9:15.
9-5/8” x 5-1/2” – > 20% methane, Sample ID: 2371-G012312015-02, Collected at 9:20.
Observed flow:
13-3/8” x 9-5/8” – after 10 minutes the vent emissions were able to inflate a sample glove taped to the annulus.
9-5/8” x 5-1/2” – slugs of fluid limited ability to gauge flow, but flow rate appeared to be greater than 13-3/8” x 9-5/8”.

Methane monitoring yielded 4% on 13-3/8" x 9-5/8" annulus

Well was not in production. Well was granted inactive status on 9/30/2009 by the DEP. No annual renewal of inactive status was submitted after the five year inactive time (after 2014). Hence, operator failed to place the gas well into production anc

identified the annular vent on the east side of the well as the 20” x 13-3/8”. The vent on the west side was identified as the 13-3/8” x 9-5/8” annulus. These vents were monitored for combustible gas using an Altair 5X gas meter (calibrated on 8/8/16). 20” x 13-3/8”: no combustible gas detected
13-3/8” x 9-5/8”: 44%combustible gas /volume, no detectable flow

At an unnamed tributary (UNT) of East Branch Tunungwant Creek located approximately 300 feet east of Crowl # C7, an above ground gathering line is currently laying in the UNT. The line became separated at a threaded collar that appears to have been loosened when the riser on the bank of the UNT was impacted by a vehicle.

At the onset of this inspection, this well was not in production and there was no product discharging from the line. After a representative from Farrington and Hepler arrived, the well was briefly turned on, and crude oil did discharge from the line when the well was pumping.

There is evidence of crude oil in approximately 1400' of the UNT, with oil pooled in still water and underneath rocks in the stream bed. There is also an extensive amount of oil soaked leaves in the stream and along the stream bank.

No waiver to Beaver Run Reservoir; E&S OK.
Drilling is complete, well is not equipped for production. No accelerated erosion and sedimentation noted on the access road or well site. The site is well vegetated. At the time of the inspection, the following deficiency was noted:
1- The well was drilled over a year ago and the well is still not equipped for production. After total depth is reached, the operator has one year to bring the well into production. If, for whatever reason, the well is idle for 12 months and no request for inactive status has been received, then the well is considered abandoned and the operator must plug it in accordance with statutes and regulations.

Contacted operator president, Terry Holt, to clarify the status of this well. It appears that Great Oak Energy is in the process of applying for inactive status for this well.

Jarrod Shultz will do a follow-up of this site to verify that the well has received inactive status.

Today's follow-up inspection was to determine if the BMPS located at the head of the small ravine up in the farm field, that had been repaired/redesigned on 1/12/2012, where preventing sediment laden run-off from leaving the site/access road an
Inspection completed in follow-up to my 1/11/2012 inspection.Upon inspection I found the BMPs tha have been installed in the low spot of the access road, at the head of the ravine, failing allowing sediment to enter the small stream. Complete deat

No well tag, no alternate disposal of pit approval, petroleum fluids and rags on ground
No well tag, petroleum product and rags on the ground

On 7/14/16, I performed a complaint inspection for the following sites in response to complaint number 320942 and made the following observations:
•Eakin 1: A moderate erosion channel was observed running along the site access road. Black staining was noted around well head/equipment indicating a spill of petroleum product. This constitutes a violation of 25 Pa. Code § 78.54 for failing to control or dispose of oil in a manner that prevents pollution to the Waters of the Commonwealth.
•Eakin 2: There appears to be an area of wetlands as evidenced by the presence of wetland vegetation is noted to be in close proximity to this well. Special caution is advised to prevent contamination of Waters of the Commonwealth.
•Eakin 3: Due to heavy vegetation including poison ivy and other noxious species around well equipment only limited inspection was possible. Continued failure to maintain a site in such a state as to allow for inspection can constitute a violation of the well permit conditions. Remediation and improved site maintenance is strongly encouraged.
•Eakin 4: The well equipment appears to be poorly maintained with the shut off valve potentially obstructed by vegetation and ground. No violation, remediation strongly recommended.
•Eakin 5: The berm around storage tank is holding water and growing cattails. The well head and equipment are partially overgrown preventing complete inspection. No violation, remediation recommended.
•NAT Industries 1: The well equipment was obstructed by vegetation preventing completion of inspection. No violation, remediation strongly recommended.
•NAT Industries 2: The access road that leads to NAT Industries 1&2 leads through a section of wetland. The tire tracks were submerged in roughly 6-12” of water at the time of inspection and were surrounded by wetland vegetation including cattails and duckweed. This constitutes a violation of 25 Pa. Code § 105.11(a) for failing to obtain a permit from the Department prior to constructing, modifying, or maintaining a water obstruction or encroachment.
•NAT Industries 3: A large erosion channel leading off of the access road and into the surrounding brush was found near coordinates N40°11’03.29” W80°01’01.32”. This constitutes violations of 25 Pa. Code § 78.54, 25 Pa. Code § 102.4(b)(1), and 25 Pa. Code § 102.11(a)(1) for failure to design and implement measures to prevent accelerated erosion.
•The above wells are listed in GIS and labeled as belonging to Hayden Harper, per the complainant and former Hayden Harper representative Eric Linn all wells were purchased by K Petroleum (OGO-68741). Mr. Linn also responded that Hayden Harper was in bankruptcy and provided contact information for Alfred T. Giuliano as a person to contact concerning the above wells; no response had been received from Mr. Giuliano or from any representative of K Petroleum at the time of filing. As no documentation was provided and no response was received from either operator notices of violations will be filed to both operators pending clarification of the well ownership. If the wells were transferred without notification it constitutes violations of 25 Pa. Code § 78.13(a) and 25 Pa. Code § 78.14(c) by the seller and of 25 Pa. Code § 78.14(a) and 25 Pa. Code § 78.14(b) by the new owner for failing to submit appropriate documentation relating to the transfer of the wells.

Spoke with Complainant on 1/15/2014. Set up a meeting for Friday 1/17/2014. The Department also contacted the Operator in 1/15/2015 to inquire about the current condition of the site. As on 1/17/2014 the Department has not received a return phone call from the Operator.
Department records indicate well was permitted on 1/2/2008 and expired on 1/3/2010. At the time of inspection, site construction appears to have commenced, as indicated by what appears to be an access road and unlined drill pit. Well not drilled and site has not yet been restored. Construction equipment present on site during inspection. Per current regulations if a well site is constructed and the well is not drilled, well site shall be restored within 30 days after the expiration of the well permit.

Department requests Operator follow-up with Department, in writing upon investigation of reported concerns identifying cause of violations, what Operator has done and will do to correct situation and achieve compliance and schedule/time frame of anticipated compliance activities.

Department records indicate exisiting outstanding violatons under 25 Pa. Code § 78.65(2) dated 1/17/2014 (Insp. ID# 2237700 and Enforcement ID# 306689).

The access road is a existing road.
The road is muddy and water from a stream and a beaver pond is coming onto the roadway. The operator has been notified by the drilling inspector that this is not acceptable.
A culvert has been replaced at the crossing and rock is being hauled in to stablize the road.
No BMPs were used on this road and sediment from the road is being washed down Beaverdam Run to Falls Creek approximately 2 miles.
No E+S plan seen at this site.

Well site i.d. sign is posted on the access road.
E+S plan does not meet the requirements of chapter 102.
No BMPs used at this site.
Well has been drilled and shut in.
Pit on site lined with a 20 mil. liner.
No visible holes in the liner. Pit does have adequate freeboard.
Site is located on a side-hill in a forrested area.

Inspection conducted with oil and gas inspector Steve Lencer.
Well is equipped for production. Pump jack installed. No tank. Well tag in place.
Access road stabilized. Site is stabilized with adequate vegetation.

Inspection revealed the following deficiencies:

1) Discharge of industrial waste to the ground. There is a large oil stain originating from the well head and extending down-gradient approximately 5 -6 feet. The cause of this discharge needs to be corrected, and the area needs cleaned up.

Late on 3 May 2013, it was discovered that the brine tank at this well site had overflown and spilled an estimated 4-5 bbls of brine/oil mixture to the ground. The operator reported the spill to DEP outside of normal duty hours.

Inspector arrived at the site on 6 May 2013 and cleanup operations were still ongoing. The crew was excavating flow pipes and had disconnected production equipment from the well head. Piping and equipment had been placed on containment. The spilled contaminant had been recovered and hauled for disposal. The spill did not reach the creek.
This is a violation of 35 P.S. § 302(a) and concurrently violations of 25 PA Code § 78.57(a) and § 78.54. Due to limitations of eFACTs it is recorded as a SWMA 301 violation.

constructed in the road ditch to contain the oil. There was crude oil present in both siphon dams at the time of inspection. There appeared to be approximately 1 gallon of oil on the surface of the pit and siphon dams. However,because the spill was not reported, the actual quantity of oil spilled is unknown. It does appear that it was a reportable spill.

Arrived @ 13:20. Weather: sunny and warm. This is a follow-up inspection. Previously on 1/26/16, my meter detected gas on an annular vent which did not appear to be labeled. An inquiry to Dale Fidurko (Inflection) yielded the following information: for cellars filled with gravel, the diameter of the outer casing is generally bead-welded onto the annular vent and thus provides a permanent label.
ARWH 1H: Gravel in cellar. Top-holed with 3 annular vents and night cap. Each of the 2” vents on either side of the wellhead had the number 13 bead-welded onto the pipe indicating that these vents corresponded to the 13-3/8” x 9-5/8” annulus. The single 1” vent had the number 20 bead-welded onto the pipe indicating that this vent corresponded to the 20” x 13-3/8” annulus. At the time of my inspection, field monitoring detected 10% methane in the 20” x 13-3/8” vent (Altair 5x calibrated on 2/2/16).
No gas was detected at the other vents.

Incident response, spill notification, 25 gallons of produced fluid 9/22/2016.
Inflection Energy notified the Department of a release of produced water/blended water to the gravel pad surface. According to the notification, the elevated conductivity was just recently discovered and the release was estimated at 25 gallons but the release was being investigated further.
I entered the site off Yeagle Road at 14:28 and met with Inflection Energy representatives.
At the time of the inspection CalFrac was completely rigged-down and had left the site. Onsite at the time were the two fresh water tanks, one waste tank, centrifuges, filters, working tanks, sand equipment and containment around the well heads. Personnel onsite were vacuuming water which was accumulated on the gravel pad surface between the working tanks and the sand equipment (north of the well heads). Personnel onsite also excavated pad material on the north and east sides of the working tanks. Water in both of these excavations (on the pad surface) had field conductivity between 800-1,100 umhos/cm. Water accumulated on the pad surface west of the working tanks (between the working tanks and the sand equipment) had field conductivity between 6,300-6,600 umhos/cm. Sample 3440292 was collected from water ponded in this area at 14:45 (photo attached). After collecting the sample noted above, I walked the site with representatives of Inflection Energy. Field conductivity of water on containment on the site was between 1,250-1,400 umhos/cm. The centrifuge was in use at the time and field conductivity of water ponded nearby was 162-170 umhos/cm. Finally, field conductivity in a puddle (on the pad surface) between the main pad containment and the sand equipment was 2,400 umhos/cm. Based on my field investigation, conductivity was highest around the working tanks. I recommend evaluating the containment

No E&S Plan, Well Complete 17 months ago and no restoration/report, waste lying around site
>5 acres disturbance and no ESCGP, accelerated erosion, pit has holes in liner, waste lying around site
E&S Plan inadequate, fluids/cuttings on ground, pit has holes in liner, and no well record/completion report submitted
Residual waste lying around site and caught up in soil, site not fully restored yet, impoundment has holes in liner
No e&S Plan on site and residual waste lying around site

Inspection in response to SR#04-063-007. Discharge of Industrial waste into Whitaker Run ; Via apparent underground hydraulic connection south of site at spring area. Drilling complete;TD 4975'.
Inspection in response to SR#04-063-007. Discharge of Industrial waste into Whitaker Run ; Via apparent underground hydraulic connection south of site at spring area. Drilling complete;TD 4975'.
Well is equipped for production. Well tag in place. Access road is stabilized.

Inspection revealed the following deficiencies:

1) Discharge of industrial waste to the ground. - A large oil stained discharge was found around tank and production equipment and continuing down-slope on the site. Vegetation in and around this area was dead. Absorbant material was placed in and around discharge, but appeared to be ineffective at containing the discharge and preventing it from seaping into the ground. All contaminated soil must be removed and properly disposed of. Site should be limed, fertilized, reseeded, and properly restored. 2) Failure to stabilize. - The rock pit that is adjacent to this well site, and was utilized to construct the site/access road is considered to be part of the site and must be stabilized/restored upon completion of the earth disturbance. This pit remains open and unrestored. The pit must be restored and properly stabilized. The above violations were discussed with operator representatives Jim Mcelwain and Cliff M

Conventional oil well in the process of being drilled at the time of inspection. The operator had dusted the drill cuttings and tophole water downslope in to a vegetated area. Apparently, tophole water saturated with cuttings had made its way into a spring seep causing the seep to run gray. The operator installed sediment traps and filter sock to stop the discharge. By the end of the day the seep was running clear. The violation was corrected. No additional violations were noted.

Apparently, tophole water saturated with cuttings had made its way into a spring seep causing the seep to run gray. The operator installed sediment traps and filter sock to stop the discharge. By the end of the day the seep was running clear. The violation was corrected. No additional violations were noted.

Fluid is not coming out of the second tank, but all the tanks are full and the second tank is very nearly overflowing.
The plastic discharge pipe coming from the 3rd tank is leaking and the fluid is running onto the ground and under the tanks.

E&S Plan and Controls inadequate, pit has holes in it and violates freeboard requirement, trash and cuttings all over the ground, no site ID sign

onsite meeting with operator - E&S concerns discussed
Discharge to S. Branch Plum Creek
Discharge to S. Branch Plum Creek
Well spudded 6/3/10. Site ID sign in place. E&S plan on site. Well is not equipped for production (well head only). Lined drill pit appeared sound, and had adequate freeboard.
Inspection revealed the following deficiencies:
1) Discharge of pollutional materials in the form of sediment to waters of the commonwealth. - Due to the slope/layout of the site and access road a large volume of water and sediment ran off the site and down a portion of the access road to a low lying area. From this point the sediment was carried along the low lying area and into an adjacent pond approximately 200 feet from the access road and well site. Sediment laden run off was observed flowing from the site/access road and directly into the pond which was completely brown from sediment. This flow was approximately 3 to 4 feet wide and had overwhelmed the BMP's that were installed. 2) Failure to minimize accelerated erosion, implement E&S plan, maintain E&S controls, and to stabilize site. Access road was not stable at time of inspecti

There was difficulty findining the site which resulted in the date of the inspection passed the spud notification.
Both the Glass 8 and Glass 10 have an extended access road through the land owners property. Nearly the entire extent of the road was devoid of any BMPs. At the base of the road below the Glass 8, the road crossed a small creek. Because there were no BMPs installed, muddy water was leaving the road and entering the culvert and the creek. This was discussed with Doug Wadsworth (Keyrock) via phone conversation. He stated someone was to fix the problem asap.
The well was drilled and frac'ed and in production.
Site was very roughly graded. Pit had been removed. No stabilization measures were taken. The silt fence was comprimised. These matters were also discussed with Mr. Wadsworth. There was no well tag yet placed on the welll. Mr Wadsworth stated these were to be installed immediately.

of the release at 1000. Hence, violations are being issued for failure to report a reportable release of brine within 2 hours after discovering or detecting the release.Upon receipt of the spill report, Department contacted Mr. Bucheit via phone at 0900. Mr. Bucheit stated that the landowner notified the Operator on 1/31 at 1000 of the release. The length of time that this release occurred for is unknown. Upon notification, the well was shut off and the fitting fixed.At this time, Mr. Bucheit estimates the quantity of released fluids to be greater than 100 bbl of produced water mixed with coal fines. Stewart Run is not reported to be impacted at this time.Violations issued under 78.54 abd 78.66(b). Add'l viols may be forthcoming. ADD'L COMMENTS ON PAPER SAIR.

See hard copy.
See hard copy.
At the time of inspection well appears equipped for production. Well tag present and affixed in a permanent manner. Three brine tanks located on site and appear to be structurally sound.
During inspection, Department observed what appears to be remnants of a prior spill, as indicated by black, visibly stained soil/gravel, with areas of visible sheen. Impacted area is surrounding the wellhead and measures approximately 5'x5'. The spill appears to be localized to the wellhead area. No active leaking was observed at the time of inspection.
Department contacted Operator to notify of finding and to request additional information.
At 11:20 Operator (Bill Keef) returned Department's call. Operator informed Department that a representative was going to visit site.
At 12:30 Operator (Doug) called Department to confirm Department findings. Based on preliminary observations, Operator estimates less than a barrel of production fluid was released.
At 15:00 Operator (Michael Bucheit) called Department to confirm Department findings and to inform that clean-up efforts have been initiated.
Department informed Operator of findings and recommends Operator perform cleanup in accordance with Spill Policy. Department requests Operator follow-up with Department upon investigation of reported concerns. Department also requests Operator provide, in writing, additional information on when release occurred, cause of the release, amount and nature of material released, clean-up actions taken and anticipated clean-up timeline.
Violations are being issued under 25 PA CODE 78.54 and 25 PA CODE 91.33A. Additional violations may be forthcoming pending Departmental investigation.
Department will conduct follow-up inspections to monitor remediation progress.

Admin inspection conducted as follow-up to inspection record 2318622.Results of soil samples collected by Department (inspection record 2318622) received from BOL.Based upon the Department's visual observations and soil sample results, it appears that a release of production water did occur at this well site. The results correspond with the Department's visual observations that a release appears to have originated near the tank valve into the vegetative dike, over the side of the dike, and into the down-gradient field. Hence, violations are being issued for this reportable release of production fluids as this inspection was previously pending awaiting the receipt and review of the sample results as collected by the Department.As no releases and/or spills are documented to have been reported to the SWRO for this well, violations are being issued for failure to notify the Department of a reportable release of brine to the ground.
Additional comments on paper SAIR.

On-site inspection conducted in response to admin inspection ID 2464737 for the reported release of brine water and crude oil. Per Mr. McDaniels, a release of 13 bbl brine water and 1 bbl crude oil occurred as a result of the plastic brine tank catching fire at 1145 on 3/8/16. Mr. McDaniels stated that the release was contained to the well site and believes most of the fluids were burned off.
Mr. McDaniels stated that while the well-tender was blowing the well, the tank caught fire and exploded, and the lid landed approximately 50 feet off of the well site. No injuries were reported. At this time, the Operator is unsure as to what exactly caused the brine tank to ignite.Violations are being issued for this release of residual fluids reported by the Operator. Additional violations may be forthcoming upon further review and investigation.
ADD'L COMMENTS ON PAPER SAIR

The purpose of my inspection today was to determine if the installed E&S controls prevented pollution to water of the Commonwealth during this time of heavy rain and snow melt. Upon inspection I found that due to an extraordinary amount of rain

On 7/26/12 at approximately 1300HRS a call was made to SWRO DOGO from Williams reporting a release of approximately 15gals Tri-ethylene Glycol from a pipeline station. The call was taken by Eric Draper and forwarded to myself at approximately 1445hrs 7/26/12- Dept. spoke to Williams EHS Rep Lindsay Sumpter whom stated that at approximately 0945 am (7/26/12) 15gals of Tri-ethylene Glycol was released on to grounds of commonwealth while personnel were preparing to place line into operation. Absorbents were used to removed free liquid fraction which were then placed into buckets/barrels. Soils were being excavated in areas of release and again placed in barrels. No waterways and/or water wells believed to be effected as of time of this report. A follow up site inspection will be conducted to ensure that operator proper remediation measures were performed and that all materials released have been successfully removed, disposed of, and site restored to pre-disturbance conditions.

Minor, self-reported landslides in Amwell Township, Washington County on a Pipeline Project.
On 5/30/2014, I performed an inspection of Laural Mountain Midstreams Bruno to Citro pipeline site. The site is located in Franklin Twp., Greene County. The inspection was performed because of an earth movement on the pipeline right of way.

The operator informed the DEP that a slide at a stream crossing for a unnamed trib. to Browns Creek had occured. The slide material has caused the BMPs to fail and has entered the stream.

The operator was monitoring the site and is preparing plans to apply for an emergency 105 permit to address the slide and impacts to the stream channel.

The Department received a response to its Notice of Violation on January 6, 2015 and a hard copy on January 20, 2015. The Department reviewed the response on January 22, 2015. Williams indicates in the response that the areas delineated as wetlands were seeded with wetland seed mix, and have provided photograhps to show vegetative growth. Repairs were delayed due to legal issues between the landowner and Williams.

In regards to the seep, an underground trench was installed within the Right of Way in an attempt to keep the water from the seep underground, which would allow the vegetation to grow. The seep continues to manifest itself on the surface, although it appears to be less water than previously observed. Williams believes that the seeps are a result of previous mining activities. This area is still not restored to satisfy restoration requirements under Chapter 102.

Onsite inspection the with company representative Nicole Miller. At the time of inspection the pipeline appeared to be installed and all earth disturbance associated with the ESCGP appeared complete. The Department notes the all perimeter contrc
•The operator reported at 8:30pm 6/16/15 that storm water and sediment circumvented a water bar on a slope and left the LOD; the water was not reported to have reached a stream or wetlands and cleanup/remediation was begun immediately.
•Site inspection suggests that the operators report was accurate.
•Cleanup and remediation were ongoing but appeared successful at the time of inspection.
•At time of inspection only residual dirt was left on the grass outside the LOD, straw bales were added to divert any further water into the approved BMPs, and equipment was being moved into place to vacuum remaining soil and reinforce the existing BMPs.

•The operator notified the department that the project had been constructed outside LOD in some places (construction foreman on a few jobs was taking landowner requests in contradiction with permits, foreman no longer with company). Variances were noted by the operator while checking pipelines for NOT preparedness.
•The area of the pipeline that was outside the LOD was at a stream crossing, the changes do not appear to have had any more adverse impact than permitted. However, this is a violation in that it is a major modification (change of LOD) conducted without a permit.
•Area of pipeline inspected (last 1000-2000 feet on east end of line) appeared generally well vegetated at time of inspection.

On 11/04/15 at approximately 1500 hours I conducted an administrative review of the Springhill to Bezjak pipeline. Laurel Mountain Midstream notified the Department that parts of the pipeline were built outside of the approved LOD. This is a violation of 102.5(m)(4) for failure to perform work to specifications. It is recommended that the as built drawings be provided to the Oil and Gas Engineering section as a minor modification.

On 11/04/15 at approximately 1400 hours I conducted an administrative review of the Constantine to Lynn pipeline. Laurel Mountain Midstream notified the department that parts of the pipeline were built outside of the approved LOD. This is a violation of 102.5 (m)(4) for failure to perform work to specifications. It is recommended that a minor modification be submitted to the Oil and Gas engineering section showing the as built location of the pipeline and area of disturbance.

On 11/04/15 at approximately 1400 hours I conducted an administrative review of the Constantine to Lynn pipeline. The relocation of the LOD caused the pipeline to cross through a stream. This encroachment was not permitted and is a violation of 105.11(a). It is recommended that the as built drawings be provided to the Oil and Gas Engineering section as a major modification and that an after the fact 105 permit for the encroachment be obtained.

On 11/04/15 at approximately 1500 hours I conducted an administrative review of the Mutnansky 1469 to 20”/24” Trunk pipeline. Laurel Mountain Midstream notified the Department that parts of the pipeline were built outside of the approved LOD. This is a violation of 102.5(m)(4) for failure to perform work to specifications. The relocation of the LOD caused the pipeline to cross through a stream. This encroachment was not permitted and is a violation of 105.11(a). It is recommended that the as built drawings be provided to the Oil and Gas Engineering section as a major modification and that an after the fact 105 permit for the encroachment be obtained.

On 04/15/16 at approximately 0900 hours I conducted an administrative review of the Springhill to Bezjak pipeline. On 02/15/16 The Gateway Engineers Inc. submitted an application for a GP 5 on behalf of Laurel Mountain Midstream, LLC (LMM). The GP 5 application is for after the fact coverage of two stream and one wetland crossing that were previously constructed outside the LOD. This is a violation of 105.11.

Additionally, LMM permitted a crossing of George’s Creek, but did not construct the crossing in the proposed location. This is a violation of 105.44 for failure to perform work to the specifications of the original permit. The new location of the crossing also caused a PEM wetland and an ephemeral stream to be crossed. This is a violation of 105.11.

The representatives for the Department were:
Dan Counahan, Environmental Group Manager
Mohamed Sam, Environmental Engineer
Justin Najewicz, Water Quality Specialist

The representatives for Williams were:
Tara Meek, Supervisor of Permitting
Stephanie Ranker, Permitting Specialist
Jayme Stotka, Environmental Health & Safety Specialist III

The first location observed (39°56’45.89”N, 79°43’17.11”W) was a gravel launcher receiver pad that had been graveled, but was well vegetated. There were no signs of accelerated erosion at the time of inspection. A violation of 102.5(m)(4) has resulted for the unpermitted impervious area.

The second location observed (39°57’53.13”N, -79°48’01.68”W) was a gravel launcher receiver pad that was approximately 85’ by 30’. The area surrounding the pad was well vegetated and there were no signs of accelerated erosion observed. A violation of 102.5(m)(4) has occurred as a result of the unpermitted impervious area.

The representatives for the Department were:
Dan Counahan, Environmental Group Manager
Mohamed Sam, Environmental Engineer
Justin Najewicz, Water Quality Specialist

The representatives for Williams were:
Tara Meek, Supervisor of Permitting
Stephanie Ranker, Permitting Specialist
Jayme Stotka, Environmental Health & Safety Specialist III

The first location observed (39°56’45.89”N, 79°43’17.11”W) was a gravel launcher receiver pad that had been graveled, but was well vegetated. There were no signs of accelerated erosion at the time of inspection. A violation of 102.5(m)(4) has resulted for the unpermitted impervious area.

The representatives for the Department were:
Dan Counahan, Environmental Group Manager
Mohamed Sam, Environmental Engineer
Justin Najewicz, Water Quality Specialist

The representatives for Williams were:
Tara Meek, Supervisor of Permitting
Stephanie Ranker, Permitting Specialist
Jayme Stotka, Environmental Health & Safety Specialist III

The first location observed (39°56'45.89"N, 79°43'17.11"W) was a gravel launcher receiver pad that had been graveled, but was well vegetated. There were no signs of accelerated erosion at the time of inspection. A violation of 102.5(m)(4) has resulted for the unpermitted impervious area.

The second location observed (39°57'53.13"N, -79°48'01.68"W) was a gravel launcher receiver pad that was approximately 85' by 30'. The area surrounding the pad was well vegetated and there were no signs of accelerated erosion observed. A violation of 102.5(m)(4) has occurred as a result of the unpermitted impervious area.

On 10/13/16 at approximately 1000 hours the Department met with Williams staff at the Constantine to Lynn pipeline to discuss two unpermitted impervious launcher receiver pads.
The representatives for the Department were:
Dan Counahan, Environmental Group Manager
Mohamed Sam, Environmental Engineer
Justin Najewicz, Water Quality Specialist

The representatives for Williams were:
Tara Meek, Supervisor of Permitting
Stephanie Ranker, Permitting Specialist
Jayme Stotka, Environmental Health & Safety Specialist III

The first location observed (40°06'33.09"N, 79°46'46.70"W) was a gravel launcher receiver pad that was approximately 40'x40'. The location surrounding the impervious area appeared to be well vegetated and was actively being grazed by cattle. There were no signs of accelerated erosion observed at the time of inspection. A violation of 102.5 (m)(4) has occurred as a result of the unpermitted impervious area.

The second location observed (40°02'50.91"N, 79°46'36.02"W) was accessed by a paved road leading to the launcher pad. Historical aerial imagery shows that the road leading to the launcher pad was originally gravel. This is a violation of 102.5(m)(4). The pad was approximately 100' by 60'. Accelerated erosion was observed around all sides of the pad. This is a violation of 102.4(b)(1). Locations of what appeared to be dead vegetation were observed. According to Williams this was the result of herbicide that was sprayed on the pad. A violation of 102.5(m)(4) has occurred as a result of the unpermitted impervious area.

Crude Oil release from an abandoned tank located on the property lease of CNX - closest well is Haysee Day #2. Crude Oil released onto the ground and into a pond which feeds an UNT to TenMile.
On January 10, 2014, I received a telephone call from Kevin Smith of CONSOL reporting a leak from the production tank of Jonah Wood #3. Leatherwood discovered the problem during a routine pipeline inspection and promptly reported it to the Department.
I followed-up on the report on January 13 and met with Danny Caldwell, the Assistant Production Coordinator for CONSOL, on-site. The production tank is about 150 yards downhill from the well and is between the well and Long Run. Mr. Caldwell told me that the well had been shut-in and out of production for about a month.
At inspection, a crew was actively pumping the production tank fluids into a temporary plastic tank. There were some solids in the bottom of the tank and the crew was placing them in drums on-site for later disposal. They also had quite a few adsorbent pads out.
On 2/11/2016, I performed an inspection of the CNX FP Headley #1 well plugging site with Joel Keller (DEP/OGI) and Joe Laslo (DEP/SMCI). Present at time of inspection was Doug Dinger (Consol). The site is located in Richhill Twp., Greene County. The inspection was performed as a site inspection after a reported sheen in an unnamed trib. to Pollen Run.

Consol Bailey Mine personnel informed the DEP that an oil sheen was documented in an unnamed trib. to Polen Run during stream monitoring associated with mining of the Bailey 2L longwall panel. At time of inspection a noted weathered brown hydrocarbon material was observed in the unnamed trib. to Polen Run down gradient from the recently plugged FP Headley #1 well site (plugged 11/16/15).

Well tag ok./ Tank sound./ Access road shows signs of erosion, as well as culvert on access road./ Some area of site are not vegetated.

Mora water supply replacement order.

Brine tank overflow and outside of diking.
Brine tank overflow and outside of diking.
Brine tank overflow and outside of diking.
Brine tank overflow and outside of diking.

Multi-well Marcellus pad.
Site ID sign, E&S plan, ERP and PPC plan on site.
At time of inspection no E&S issues observed on access road. Well pad gated. Pad rocked.
Well appears to be in production. Well tag present and legible.
Brine tank located in secondary containment. At this time approx 10 inches of liquid located in secondary containment. Department observed a hose discharging fluids from tank secondary containment onto well pad. This hose begins in bottom of secondary containment, goes over containment wall, and ends on rocked area of well pad. No oil/sheen was observed on fluid located in containment or on/around fluid released onto pad. No erosion gullies or ponding of water was observed near discharge point.
Department recorded a pH of 8.7 and specific conductivity of 1595 microsemens/cm from water sample taken from containment area and a pH of 8.6 and specific conductivity of 1595 microsemens/cm from water sample taken from discharging hose. Department contacted Operator Rep Clayton Hill (Dallas TX) by phone from site. Mr. Hill stated a representative would be dispatched to site immediately.

UPDATE 11:00: Department met with Operator Rep Matt Gary at site. Mr. Gary removed hose, stopping discharge. Mr. Gary stated he did not know when hose was installed or how much fluid was released.
Department requests Operator provide documentation stating when the discharge began, who initiated the discharge, how much fluid was discharged, and the qualitative characteristics of the fluid discharged. Also, please provide disposal manifests and tank readings for the all tanks within the secondary containment that fluids were being discharged for the last 3 months. Please submit the above documentation by 1-17-17 to the undersigned to the address listed above.
This inspection is PENDING Operator response.
Violation(s) may be issued after review of Operator response.
UPDATE 1-17-17: Department received tank levels spreadsheet and disposal manifests from Operator via e-mail. Operator states he is unable to locate hauling manifests for Nov and Dec 2016 but will provide them when they are located.
UPDATE 2-1-17: Department received Nov and Dec hauling manifests from Operator via e-mail.
According to SVS form dated 12-14-16, production fluid was taken from PMG Allen #1H and delivered to Saylor Unit frac tank. Therefore a violation is being issued for failure to properly store, transport, process or dispose of a residual waste.
In addition, no response from Operator was received concerning the qualitative characteristics of the fluid discharged. Hence the Department recorded the Specific Conductivity of the fluid at 1595 microsemens/cm and no additional information was provided by the Operator, a violation is being issued for land applied top-hole water or precipitation water that does not meet requirements for pH, conductivity and sheen. Operator is reminded that as per 25 Pa. Code § 78a.64a(g), Stormwater that comes into contact with regulated substances stored within the secondary containment shall be managed as residual waste.
Also, a violation is being issued for failure to spread top-hole water or precipitation water from a pit over an undisturbed, vegetated area capable of absorbing the water.

Inadvertent Return of bentonite drilling mud into an UNT to Pigeon Creek, near Grange Road in Fallowfield Twp during HDD bore operations. After hour complaint phone call on 6/20/13 - Emergency Response could not determine if material was co
Routine/partial inspection of pipeline project north which is currently at least 10 miles or more in length currently active. An low-lying drainage area in Carroll Twp was noted to have had sediment discharged outside the limit of disturbance. Also, no

received. These are General Permits such minor road crossings, temporary stream criossings, etc

Well abandoned; not equipped for production.
Accelerated erosion occurring on access road.
Annulus open.
Follow up inspection; well appears operating. E&S still occurring on access road. 3-10-04...Spoke w/ D. Martha by phone.

Drilling was completed on 2/19/2009
Well appears to be in production at this time.
The access road is in good condition. Operator failed to implement and maintain E&S controls leading to sedimentation being carried off site and around the controls. The silt fence was down off the stakes and the rock outfall that was called for on the E&S plans was never implemented. The operator was contacted immediately and was informed about the violations. The Department also requests that the operator investigates the discharge of industrial waste to the ground.

Well appears to be in production at this time.
The access road is in good condition. Operator failed to implement and maintain E&S controls leading to sedimentation being carried off site and around the controls. The silt fence was down off the stakes and the rock outfall that was called for on the E&S plans was never implemented. The operator was contacted immediately and was informed about the violations. The Department also requests that the operator investigates the discharge of industrial waste to the ground.

Drilling was completed on 2/5/2009
Well appears to be in production at this time.
Site is not restored and vegetation has not achieved 70 % uniform coverage but the site is under 9 months.
The access road is in good condition. Operator failed to maintain E&S controls leading to sedimentation being carried off site and around controls.

The Department conducted an investigation in accordance with the complaint filed alleging that the operator had no E&S controls and no permit to drill. Operator did post the site Id sign and had the permit posted on site but failed to implement E&S and BMPs in accordance with the E&S plan posted on site.
The operator cleared the site and put the topsoil in a stockpile adjacent to the residence on the border of the property line.
Well location was staked and boundary lines were marked.

John Ley WQS, SWRO was on site to conduct an inspection. At the time of the inspection, the well label was on site. The well was drilled and equipped for production. The associated well apparatus located onsite appeared to be in sound working

On site for a routine partial inspection. Heavy rain event during inspection.

Heavy runoff from area used for temporary water line at the RE Gas Adams Well Pad is creating sedimentation and erosion that is flowing through tributary 34935 to Little Yellow Creek, causing sedimentation and erosion issues with the MarkWest Adams to Perry Pipeline crossing RC-1. This is flooding out a wetland at the RC-1 crossing and causing erosion and sedimentation issues both at the resource crossing and off LOD.

On site for a routine partial inspection. Heavy rain event during inspection.

Response to complaint #279097 alleging silt in stream. Found inadequate and missing BMPs compounded by run-off from Yearger Pad. NOV prepared and sent.
Response to complaint #279097 alleging silt in stream. Found inadequate and missing BMPs compounded by run-off from Yearger Pad. NOV prepared and sent.
I met with MarkWest to discuss the concerns I found on June 9th; I met primarily with David Ettore and Robert McHale, MarkWest¿s Manager of Environmental Regulatory Affairs. They told me that the original E&S controls were removed so that they right-of-way could be reclaimed (this process was slowed by the recent rainy weather). They pointed out that the equipment was there performing the final grading to prepare for reseeding.
We toured the area and I should them my concerns about the streams. They told me that they relied on a consultant when the plans were drawn up and that the consultant did not consider them streams. I told them that even seasonal streams were considered waterways under Pennsylvania regulations and they needed protecting. They told me they would do so.
Not protecting the seasonal streams is a violation of the standard permit and the Clean Streams Act.

Checked self-reported storm damage on LL Day to Baker Pipeline segment. Sediment in streams but self-reported and immediately corrected.
Inspected self-reported problem on Pettit Road in Amwell Township, Washington county. 2 inches of rain in an hour overwhelmed BMPs. Company cleaned out stream and repaired. I visited on Aug 18 and found the problems corrected.
Inadvertant Return (IR) of drilling mud (bentonite clay - no additives) during HDD of Rural Valley Rd and Wolf Run. Violation of CSL 301/307/401/402 and SWMA 301. Rig shut down and release contained/mitgated. Corrective action - dig a vertica
Inadvertant Return (IR) of drilling mud (bentonite clay - no additives) during HDD of Rural Valley Rd and Wolf Run. Violation of CSL 301/307/401/402 and SWMA 301. Rig shut down and release contained/mitgated. Corrective action - dig a vertica

Inadvertant Return of drilling mud (bentonite only - no additives) to Wolf Run (violation of CSL 301/307/401/402) and also surfaced to the ground next to the stream (violation of SWMA 301). Corrective Action - vertical relief trench didn't work - will d
Inadvertant Return of drilling mud (bentonite only - no additives) to Wolf Run (violation of CSL 301/307/401/402) and also surfaced to the ground next to the stream (violation of SWMA 301). Corrective Action - vertical relief trench didn't work - will d
Loss of return to vertical bore hole (clogged) - IR to original area - cited as a recurring violation of CSL 301/307/401/402 and SWMA 301 Corrective aciton - periodically clean vertical bore
Loss of return to vertical bore hole (clogged) - IR to original area - cited as a recurring violation of CSL 301/307/401/402 and SWMA 301 Corrective aciton - periodically clean vertical bore

Failure of pipe fitting - ~25 gallons released to Wolf Run - cofferdam installed immediately in stream to contain all pollutional material (bentonite clay). Violation of CSL 301/307/401/402 and SWMA (301). Corrective action - installation of fused HDP
Failure of pipe fitting - ~25 gallons released to Wolf Run - cofferdam installed immediately in stream to contain all pollutional material (bentonite clay). Violation of CSL 301/307/401/402 and SWMA (301). Corrective action - installation of fused HDP
Inadvertant Return of bentonite to UNT of Robinson Fork and also surfaced to the ground. Violations of CSL 301/307/401/402. HDD bore of SC-40 utilizing air and water only - an 8" line was installed ~2yrs ago with bentonite drilling mud - current d
Inadvertant Return of bentonite to UNT of Robinson Fork and also surfaced to the ground. Violations of CSL 301/307/401/402. HDD bore of SC-40 utilizing air and water only - an 8" line was installed ~2yrs ago with bentonite drilling mud - current d
Inadvertant Return of bentonite to UNT to Robinson Fork (SC-40) and WL-16. Current HDD bore utilizes no mud (air and water only) - mud is surmised to have been in an existing pocket from an 8" line installed ~2yrs ago and is located within feet
Inadvertant Return of bentonite to an UNT to Buffalo Creek. Unknown quantity - containment put into place and periodically is being vacuumed up for proper handling. Violation of CSL 301/307/401/402.
Inadvertant return into an UNT to Buffalo Creek, bentonite also surfaced in floodplain area. Violation of CSL 301/307/401/402. Area contained via cofferdam in the stream - area being pumped up to top of hill and into a filterbag which was only partia
Inadvertant return into an UNT to Buffalo Creek, bentonite also surfaced in floodplain area. Violation of CSL 301/307/401/402. Area contained via cofferdam in the stream - area being pumped up to top of hill and into a filterbag which was only partia
4/23/13 - Inadvertant return to area adjacent to stream channel #40 - vertical relief bore clogged - violation of SWMA 301.
4/24/13 - Inadvertanet return to stream channel 40 - vertical relief bore open - violation of CSL
4/23/13 - Inadvertant return to area adjacent to stream channel #40 - vertical relief bore clogged - violation of SWMA 301.
4/24/13 - Inadvertanet return to stream channel 40 - vertical relief bore open - violation of CSL

As part of my investigation, I inspected the MarkWest, Strawn to Amwell East pipeline project (ESX12-125-0106) and I found violations.

First MarkWest did not stabilize the project and rills and gullies were forming. Second, I found several areas where the E&S controls were not maintained and overrun with sediment. Finally, I found evidence that the sediment had reached the stream at SC 1 and SC 2 (GP05630712).

I did find documentation in the mailbox.

Marwest owner of gathering pipelines, Range owner of nearby well sites. This is the Varner to Zappi Pipeline (ESX12-125-0089)
Buffalo to Welling gathering line. MarkWest is the gathering line owner, nearby well sites are Range.

4/15/2015, I performed an inspection of Mark West Midstreams Greaves to Hunter pipeline site. The site is located in Donegal Twp., Washington County. The inspection was performed as a routine site inspection post rainfall event.

The operator has constructed much of the BMPs (silt sock) outside of the LOD. The sediment load and accelerated erosion related to the failure of the silt sock is outside the LOD. Failure of the BMPs caused sediment to travel outside the LOD and discharge into and impacting ST46710 an unnamed tributary to Middle Creek. The operator has constructed a water collection channel outside the pipeline LOD to gather spring flow before entering the ROW and redirecting the spring flow to sumps dug along the LOD. During the site inspection an open trench stream crossing was being completed and the trench dewatering structure and filter bag became overwhelmed with sediment and discharged sediment outside the LOD. The operator will need to address these deficiencies.

Site ID sign in place. E&S plan on site. Inspection conducted with oil & gas inspector Rick Hoover. Well spudded 2/15/11.
Drilling is completed. Well not equipped for production (well head only). Service company on site logging well at time of inspection.
Well located in high quality watershed - Little Mahoning Creek.
Drill pit appeared sound, and had adequate freeboard.
Operator utilized an old, pre-existing, unstabilized, and unmaintained roadway for approximately 3500' to access the new well site. Inspection revealed the following deficiencies: 1) Failure to minimize accelerated erosion, implement E&S plan, maintain E&S controls, and to stabilize site. Did not appear to be any attempt to stabilize the access road. Many signs of erosion were found on roadway, with sediment going into adjacent streams. 2) E&S plan not adequate. 3) Failure to implement special protection BMP's for HQ stream. 4) Stream discharge of industrial waste in the form of sediment. 5) Encroachment without a permit. Crossed an unnamed tributary to Little Mahoning

Site ID sign in place. E&S plan on site. Inspection conducted with oil & gas inspector Rick Hoover. Well spudded 2/15/11.

Site ID sign in place. E&S plan on site. Well spudded 2/15/11. Well located in high quality watershed - Little Mahoning Creek. Drilling is completed. Well not equipped for production (well head only). Drill pit has been encapsulated and backfilled. All violations from 2/23/11 are still outstanding. Inspection revealed the following deficiencies: 1) Failure to contain pollutional substances in the form of drill cuttings/waste. Discharge of industrial waste to the ground. Drill cuttings/waste was found in a ditch line on the perimeter of the site and extended down slope about 75 feet. Appears to have been squeezed out of the pit during encapsulation. 2) Improper pit construction - pit not minimum of 20 inches from SHWT. According to onsite E&S plan SHWT at 14 to 36 inches. 3) Improper encapsulation of waste. See above. Pit encapsulated in SHWT. Cuttings appear to have been squeezed out at backfill. These were discusssed with Adam of operator. Deficiencies must be corrected. Contents of pit, liner, contaminated soil must be removed and properly di

Basin 2 discharging sediment laden water into UNT to Towanda Cr.
Basin 2 discharging sediment laden water into UNT to Towanda Cr.

Well is equipped for production. Access road and well site were snow covered at time of inspection, although no obvious signs of erosion/sedimentation were found. Inspection revealed the following deficiencies: 1) Steel brine tank is rusted out with several visible holes, and is no longer functional in its present condition. If a tank is necessary for the containment of brine/gas well fluids then it must be replaced with a sound tank. If it is no longer necessary for production then the old rusted out tank must be removed from the property. 2) Gas well needs to be properly identified with the permit number affixed to the well. Requests for both of these concerns to be corrected was made through a compliance assistance inspection on 12/23/2008, through multiple messages on the operators phone over the last two years, and through a face to face conversation with the operator in mid 2010. No effort was made to bring these issues into compliance. Inspection report and NOV will be hand delivered to operators residence, due to the lack of response.

This inspection is in respose to a Complaint received on 5/11/16(CID# 319704). The complainant was concerned about discharges from leaking oil wells and other discharges on the site. Upon inspection I found the following:

123-34543 #6 Conventional oil well equipped with a jack however the motor was missing . Adjacent to the well was a 500-600 gallon steel tank with 1" plastic pipe connecting the well to the tank. On the south end of the tank was a drain valve. The vegetation around the valve was dead and it appeared that brine had been discharged from the tank

123-34542 # 5 Conventional oil well. There was a 5x5 ft area of oil saturated soil around the well head. The well was connected to a 140 bbl stock tank. On the south side of the stock tank there was a 10ftx15 ft area of dead vegetation and a trail of dead vegetation that led into a small wetland. At the time of inspection fluid was dripping from the tank via a 2" orange plastic pipe . There was no containment around the tank.

I also found a 2000 gal. lay down steel tank (41 56 30.7 Lat 79 18 54.6 Long)connected to an oil line that appeared to contain oil. There was no containment around the tank. Based on the dead vegetation , it appeared there were historic brine discharges occuring at this location

I found 2 other lay laydown tanks that appeared to contain oil (Coordinates :41 56 29.4 Lat, 79 18 56.4 Long) (Tank # MP 273 480543) There was no containment around either tank. Adjacent to these tanks were 3- 55 gallon drums leaking crude oil as well as an open topped steel tank approximately 1/2 full of oil field waste. There was no containment around the tank.
Also on this site was a tank battery consisting of 2-140 bbl stock tanks(43224 351). There was pooled oil around the base of the tanks and one tank appeared to be leaking

123-33138 Irwin # 4 Conventional oil well completed and in production. The well had a stuffing box leak and there was a pool of oil approximately 10 ft long and 5 ft wide around the well. Adjacent to the well was a tank battery consisting of a approximately 2000 gal horizontal stock tank # 480982 MP-485 a steel brine tanks as well as various 55gal drums. There was minimal containment. Next to the tank battery was a brine pit approximately 100 ft long and 30 ft wide. It appeared that there had been some kind of spill in the past. Brine was dripping from the brine tank into the pit. It also appeared that brine was leaching out from the base of the pit into a small drainage way

This inspection is in respose to a Complaint received on 5/11/16(CID# 319704). The complainant was concerned about discharges from leaking oil wells and other discharges on the site. Upon inspection I found the following:

123-34543 #6 Conventional oil well equipped with a jack however the motor was missing . Adjacent to the well was a 500-600 gallon steel tank with 1" plastic pipe connecting the well to the tank. On the south end of the tank was a drain valve. The vegetation around the valve was dead and it appeared that brine had been discharged from the tank

123-34542 # 5 Conventional oil well. There was a 5x5 ft area of oil saturated soil around the well head. The well was connected to a 140 bbl stock tank. On the south side of the stock tank there was a 10ftx15 ft area of dead vegetation and a trail of dead vegetation that led into a small wetland. At the time of inspection fluid was dripping from the tank via a 2" orange plastic pipe . There was no containment around the tank.

I also found a 2000 gal. lay down steel tank (41 56 30.7 Lat 79 18 54.6 Long)connected to an oil line that appeared to contain oil. There was no containment around the tank. Based on the dead vegetation , it appeared there were historic brine discharges occuring at this location

I found 2 other lay laydown tanks that appeared to contain oil (Coordinates :41 56 29.4 Lat, 79 18 56.4 Long) (Tank # MP 273 480543) There was no containment around either tank. Adjacent to these tanks were 3- 55 gallon drums leaking crude oil as well as an open topped steel tank approximately 1/2 full of oil field waste. There was no containment around the tank.
Also on this site was a tank battery consisting of 2-140 bbl stock tanks(43224 351). There was pooled oil around the base of the tanks and one tank appeared to be leaking

123-33138 Irwin # 4 Conventional oil well completed and in production. The well had a stuffing box leak and there was a pool of oil approximately 10 ft long and 5 ft wide around the well. Adjacent to the well was a tank battery consisting of a approximately 2000 gal horizontal stock tank # 480982 MP-485 a steel brine tanks as well as various 55gal drums. There was minimal containment. Next to the tank battery was a brine pit approximately 100 ft long and 30 ft wide. It appeared that there had been some kind of spill in the past. Brine was dripping from the brine tank into the pit. It also appeared that brine was leaching out from the base of the pit into a small drainage way

This inspection is in respose to a Complaint received on 5/11/16(CID# 319704). The complainant was concerned about discharges from leaking oil wells and other discharges on the site. Upon inspection I found the following:

123-34543 #6 Conventional oil well equipped with a jack however the motor was missing . Adjacent to the well was a 500-600 gallon steel tank with 1" plastic pipe connecting the well to the tank. On the south end of the tank was a drain valve. The vegetation around the valve was dead and it appeared that brine had been discharged from the tank

123-34542 # 5 Conventional oil well. There was a 5x5 ft area of oil saturated soil around the well head. The well was connected to a 140 bbl stock tank. On the south side of the stock tank there was a 10ftx15 ft area of dead vegetation and a trail of dead vegetation that led into a small wetland. At the time of inspection fluid was dripping from the tank via a 2" orange plastic pipe . There was no containment around the tank.

I also found a 2000 gal. lay down steel tank (41 56 30.7 Lat 79 18 54.6 Long)connected to an oil line that appeared to contain oil. There was no containment around the tank. Based on the dead vegetation , it appeared there were historic brine discharges occuring at this location

New Florence Mining #2 - St. Clair Twp, West'd Co. - never permitted, but location made.

Site ID sign in place. E&S plan on site. Well has been drilled, but is not equipped for production (well head only on site).
Access road is stable. Distance restriction waiver from a stream approved on 3/27/2008. Well spudded on 4/7/2008.
Exact drilling completion date not available, but was completed at an inspection conducted 4/29/08 by Oil & Gas inspector Rick Hoover.
* Inspection revealed the following deficiencies:
1) Failure to restore site within 9 months of completion of drilling. - An open, lined pit containing drill cuttings remains on the site (with adequate freeboard). Topsoil remains stock-piled on the side of the site. No backfilling has occurred. Very little vegetation on site.
No seeding/mulching has been done. Failed to comply with terms and conditions of permit as the E&S plan submitted with the waiver application was not carried out on the site. Failure to minimize accelerated erosion, implement E&S plan, and maintain E&S controls. Silt fence was down and there were signs of accelerated eros.

Follow-up to inspection conducted by Curtis Small on 3/17/2009 with multiple violations noted
-no changes to site have occured. well has been approved for inactive status.
-well head is gurgling
-silt fence is beginning to fall
-pit is built within five feet of crest of steep hill
-site is in middle of high traffice public area (cemetary) pit is not protected against unauthorized acts of 3rd parties
There was no well tag observed on the well apparatus located onsite. Noted that the appeared to be a hole in the casing which was allowing fluids to flow from the well casing to the ground surrounding the well.

The well site is located in the corner in a large agricultural field along Bothwell Road in Hempfield Twp, Westmoreland County. The right side of the location is the cut slope and a berm begins in the front right corner of the well site and extends the length of the well site ~180'. Two stock piles are located on the far side of the well site. The stock piles are approximately 10' tall and 40' wide. The well site pad area does not appear to be covered with stone. The unlined pit is approximately 70' long, 30' wide and 8'-10' deep. The unlined pit contains water and vegetative growth. The site and unrestored unlined pit demonstrate mature vegetative growth. See attached photos. No site ID was located. No E&S plan located. No observation of accelerated erosion or sedimentation.

The well was originally permitted on November 11, 2004. The well permit expired on November 11, 2005.

Violations issued, see page 3.

Well appears to be in production at this time.
Site is not restored and vegetation has not achieved 70 % uniform coverage but the site is under 9 months.
The access road is in good condition.
Operator failed to install proper E&S controls where needed. Operator crossed a spring, with a defined bed and bank, causing a pollution event. Operator clearly installed absolutely no controls where the heavy machinery crossed the stream. I spoke with the site superintendent and stated all of my concerns. He stated that the E&S plan was posted on site multiple times and does not know what happened to it. He is faxing over a copy as soon as possible. The operator also stated that he will take care of the lack of E&S controls and the stream crossing

On 12/17/2014, I performed an inspection of Noble Energy's RHL4 water pipeline site. The site is located in Richhill Twp., Greene County. The inspection was performed because of a inadvertent return of bentonite based drill mud.

The IR of drill mud impacted an unnamed tributary to Dunkard Fork. At two locations drill mud returned to surface and discharged, entering a stream and wetland. Approx. 150' of stream channel was impacted by the drill mud. The operator has installed silt sock downgradient of the discharges in an attempt to prevent further impacts of the drilling mud to the waters of the state. The Department spoke with the operator on site inregards to cleanup procedures moving forward.

On 12/17/2014, I performed an inspection of Noble Energy's RHL4 water pipeline site. The site is located in Richhill Twp., Greene County. The inspection was performed because of a inadvertent return of bentonite based drill mud.

The IR of drill mud impacted an unnamed tributary to Dunkard Fork. At two locations drill mud returned to surface and discharged, entering a stream and wetland. Approx. 150' of stream channel was impacted by the drill mud. The operator has installed silt sock downgradient of the discharges in an attempt to prevent further impacts of the drilling mud to the waters of the state. The Department spoke with the operator on site inregards to cleanup procedures moving forward.

On 6/10/2015, I performed an inspection of Noble Energy RHL-23 well pad site. Present at time of inspection was Nick Frosini (Noble Energy). The site is located in Richhill Twp., Greene County. The inspection was performed as a response to a reported impared water spill by the operator.

The operator intially reported a spill of 210 gallons of impaired water from the pump down tanks during the fracking of the RHL23 FHS well. During transfer of impaired water to the pump down tanks on the well pad in preparation of fracking activity the tanks were overfilled and the impaired water was discharged off containment to the well pad. The impaired water did not leave the well pad and all well pad perimeter drains where shut in the area of the spill. The operator plans to begin
On 6/10/2015, I performed an inspection of Noble Energy RHL-23 well pad site. Present at time of inspection was Nick Frosini (Noble Energy). The site is located in Richhill Twp., Greene County. The inspection was performed as a response to a reported impared water spill by the operator.

The operator intially reported a spill of 210 gallons of impaired water from the pump down tanks during the fracking of the RHL23 FHS well. During transfer of impaired water to the pump down tanks on the well pad in preparation of fracking activity the tanks were overfilled and the impaired water was discharged off containment to the well pad. The impaired water did not leave the well pad and all well pad perimeter drains where shut in the area of the spill. The operator plans to begin
On 9/8/2015, I performed an inspection of Noble Energy RHL-23 well pad site. Present at time of inspection was Casey Bartkus (Noble Energy). The site is located in Richhill Twp., Greene County. The inspection was performed as a response to a reported spill by the operator.

The operator reported a spill of unknown amount and unkown material to the department on 9/4/15. The operator identified a section of distressed vegetation during a site inspection last week down gradient from a well pad drainage level spreader. The distressed vegetation was inside and outside of the well site LOD. The operator has shut off the valves to the level spreader and is capturing and disposing of the water collecting on site. The operator has hired Moody & Associates to begin characterizing the material spilled and identifying impacted areas for immediate cleanup. The operator plans to begin cleanup activity immediately and confirmatory sampling across the well pad during downtime between hydraulic

On 9/8/2015, I performed an inspection of Noble Energy RHL-23 well pad site. Present at time of inspection was Casey Bartkus (Noble Energy). The site is located in Richhill Twp., Greene County. The inspection was performed as a response to a reported spill by the operator.

The operator reported a spill of unknown amount and unkown material to the department on 9/4/15. The operator identified a section of distressed vegetation during a site inspection last week down gradient from a well pad drainage level spreader. The distressed vegetation was inside and outside of the well site LOD. The operator has shut off the valves to the level spreader and is capturing and disposing of the water collecting on site. The operator has hired Moody & Associates to begin characterizing the material spilled and identifying impacted areas for immediate cleanup. The operator plans to begin cleanup activity immediately and confirmatory sampling across the well pad during downtime between hydraulic
On 5/13/2016, I performed an inspection of Noble Energy WFN1 well pad site. Present at time of inspection was Nick Frosini, Ernie Thompson, and Shawn Haines (Nobel Energy). The site is located in West Finley Twp., Washington County. The inspection was performed as a response to a reported BMP failure by the operator.

The operator informed the DEP that two infiltration berms failed after a rainfall event on 5/12/16. The failures caused the recently constructed infiltration berms to errode and the perimeter BMPs to fail. Sediment laden water caused triple stacked silt sock to break and sediment and debris to traveled downgradient outside the LOD onto the neighboring property.

On 5/13/2016, I performed an inspection of Noble Energy WFN1 well pad site. Present at time of inspection was Nick Frosini, Ernie Thompson, and Shawn Haines (Nobel Energy). The site is located in West Finley Twp., Washington County. The inspection was performed as a response to a reported BMP failure by the operator.

The operator informed the DEP that two infiltration berms failed after a rainfall event on 5/12/16. The failures caused the recently constructed infiltration berms to errode and the perimeter BMPs to fail. Sediment laden water caused triple stacked silt sock to break and sediment and debris to traveled downgradient outside the LOD onto the neighboring property.

On 8/4/2016, I performed an inspection of Noble Energy WFN Impoundment C site. The site is located in West Finley Twp., Washington County. On site during inspection was Nick Frosini (Noble). The inspection was performed as a routine inspection of the site, because of a request by the operator review of the site for a termination of the ESCGP permit.

The operator constructed the access road to the site with fill outside the LOD without modification of the permit. The operator constructed the access road outside the approved LOD in two locations. During construction of the Impoundment the operator encountered excess material from the excavation and placed this material as fill along the access road. The fill was placed outside the approved LOD at approxametly 12+00, and 18+00 to 22+00 on the construction plans.

The site has been stabilized and is vegetated with greater than 70% vegetated cover. The E&S controls have been removed except a small section of silt sock along the access road fill slope.

On 8/4/2016, I performed an inspection of Noble Energy WFN Impoundment C site. The site is located in West Finley Twp., Washington County. On site during inspection was Nick Frosini (Noble). The inspection was performed as a routine inspection of the site, because of a request by the operator review of the site for a termination of the ESCGP permit.

Oil spill at tank battery on Johnston Farm, Foster township, McKean County PA. Associated with various wells on projects QSORC-169, 336 and 335.

See 12/4/08 Insp ID 1754184, past violations corrected. MBC 7/21/09
3/19/09 Insp ID 1811672 follow-up to Insp ID 1742107, all violations found to have been corrected, inspection never input timely, memo to MBC for input 7/13/09.

Drill pit with cuttings in it still on site and in taters, leachate from pit getting onto ground, site not restored
Drill pit with cuttings in it still on site and in taters, leachate from pit getting onto ground, site not restored
Unstabilized earth disturbance from pit closure, E&S Control BMPs falling down, some minor erosion, site not fully restored

During the inspection, Department observed an active leak from the base of the brine tank, as indicated by a slow steady drip. An approximate area measuring 2'x2' directly below the leak appears to be impacted, as indicated by visible dampness of the gravel. Release appears to be localized to within the well site. Production chart located on site and dated 7-1-2016.

Department's attempts to contact Operator regarding above concerns were unsuccessful due to an invalid contact number.

Department recommends Operator perform cleanup in accordance with Spill Policy and follow-up with Department upon investigation of reported concerns and to quantify release and identify all materials released if applicable within 24 hours of receipt of this inspection.

Violations are being issued under 25 PA CODE 78.57. Additional violations may be forthcoming pending Departmental investigation. Department will conduct a follow-up inspection.

pit slope failure. Managing contents. NOV sent 3/29/2010 MAB.

RTNC Insp 4/14/11.
RTNC Insp 4/14/11.

Laboratory results for sample 0940-016 (the puddle) were received and indicated Barium was present in the liquid found on the pad surface at a concentration of 20,100 µg/L. This is approximately 10 times the primary standard MCL. Consequently, the Department's inspections revealed violations of the Clean Streams Law, 35 P.S. § 691.1 et seq.; the Solid Waste Management Act, 35 P.S. § 6018.101 et seq; and Chapter 78.54.

Additionally, one well was permitted and drilled. Section 3216 of 58 Pa. C.S. §§ 3201 - 3274 (relating to Development) ("2012 Oil and Gas Act") requires an operator to restore the well site within 9 months after completion of drilling of a well. Consideration should be given to restoring the site or requesting an extension under the provisions of Section 3216(g). MRN

during todays inspection, it was observed that operator failed to properly install/maintain culvert ditches and outlets; therefore, a new violation is being written for failure to minimize erosion and sedimenation again for failure to design, implement and

Inspt conducted as follow-up to inspection record 2251906 in which compliance assistance recommended to Opr.Per Opr, recommendation implemented.Routine Partial Inspection. Well tag replaced as per Dept's recommendation.While on-site, Dept observed oil on rocks underneath heater box approx 1 ft x 0.5 ft in size.Oil appears to have "splattered" towards BT.Dept placed absorbent pad on oil.Dept unable to locate source of oil.Dept immediately called Opr Steve Phillips at 1430 and left message.Mr. Phillips called Dept back at 1500. Dept requested that Opr properly clean-up and dispose of oil, determine source of oil, and quantify the amount of oil released.Dept requested Opr re-submit well site restoration report or provide verification that it was previously submitted as Dept is unable to locate this document.
UPDATE: 4/8
At 0940, Dept conducted an on-site follow-up to oil release.Oil not removed; absorbent pad previously placed by Dept remains.
UPDATE: 8/14

On-site inspection in response to spud notification for 4/27/2015.At time of inspection, drill rig on-site. Site ID sign present. Valid drilling permit posted. E&S plan on-site.Per on-site plan, Operator representative made "field changes" to E&S plan previously prepared by certified engineer. Changes include the addition of access road culverts, substitution of BMPs, the location of the access road, and potentially the location of the wellhead.Beginning of shared access road rocked and in good condition.Beginning of access road has been re-located per changes made to the E&S plan by Operator representative.Culverts not identified on the E&S plan have been installed in several locations along the access road and are not equipped with adequate outlet protection.Silt fence with hay bales have been installed in place of compost sock as identified on the E&S plan. Silt fence is not properly installed and/or maintained.**ADDITIONAL COMMENTS ON PAPER SAIR**
Viols issued under 102.4(b)1, 102.4(b)2, 102.11, 78.56(a)4ii, 78.55(a).

Viols issued under 102.4(b)1, 102.4(b)2, 102.11, 78.56(a)4ii, 78.55(a).

At time of inspection, access road not properly maintained. Dept. observed erosion (gullies, ruts) previously identified to Operator. Although well site appears restored, temporary BMP's remain on site, even after Dept recommended Operator remove in accordance with current regulations upon permanent stabilization of site. Permanent culvert not maintained by Operator as per current regulations. Based on today's inspection, it appears that operator has not implemented numerous written and verbal recommendations to maintain compliance with current regulations. Violations being issued for:
Failure to minimize the potential for accelerated erosion and sedimentation
Failure to remove temporary E&S BMP's once permanent stabilization had been established

abandoned & unplugged/sampled fluids pooled around wellhead

operating: tag is illegible,tank leaking brine

Wise water supply - brine contamination

This well is exhibiting excessive corrosion, rust, and signs of equipment deterioration that compromise the integrity of the well. This well is iimproperly vented to atmosphere.

Inspected this well after receiving information of a leaking well.
Located well on State Game Lands. Found well with casing full of water and bubbling profusely. Gas is leaking from inside and outside of casing (approximately 6 ½” in diameter). Combustible gas readings at 100% LEL. Casing is rusting and corroded and appears to be poorly maintained. Attached is photo showing gas bubbling out from casing. (Latitude: N 40.08882¿ / Longitude: W 80.12735¿ at well.)

Note: The Department is requesting immediate remedial action to stop gas leak.

Inspected this well after receiving information of a leaking well.
Located well near Honda dealer’s storage lot. Casing is rusted and corroded and appears to be poorly maintained. There is a strong hydrocarbon odor of venting gas and hissing noise. Well appears to have recent cement repair in and around casing however there is still a significant gas leak. (Latitude: 40¿ 18' 6.7" N / Longitude: 80¿ 09' 33.8" W at well.)

Note: The Department is requesting immediate remedial action to stop gas leak.

cuttings, cement, & oil on ground, pit has hole in liner and imprpoer subbase

At time of inspection access road developing ruts. Department recommends Operator continue to monitor and maintain access road.
Well appears equipped for production. Well tag not present.
Department observed an area with a black residue along edges and no vegetation in front of the brine tank. When approaching brine tank from access road, area was immediately in front of tank and approximately 20 feet long by 12 feet wide.
Affected area was directly under and spread out from the valve on the bottom of the brine tank.
Department contacted Operator listed in eFACTS to notify Operator of what appears to be a release. Operator Rep Fred Gezich stated that they no longer owned well site; it was aquired by landowner in 1988. According to Department records, site was never transferred. Department requests Operator submit paperwork showing transfer of ownership of well.
Violations being issued for failure to install in a permanent manner the permit number on a completed well and for discharge of brine on or into the grounds of the Commonwealth.
Discharge in violation (pH, TSS, iron, alkalinity)
Discharge exceeding NPDES limits.
Review of DMRs over the past year showed effluent violations reported in May 08 (High TSS avg.). Cause of DMR violations & actions taken to correct violations were documented on DMR form. DEP conducted both influent and effluent sampling during this inspection ¿ results attached. Additional parameters were tested to help characterize waste stream & treatment.
DEP sample results showed effluent violations for TSS = 300 mg/l (permit max = 60 mg/l) & Barium = 574 mg/l (permit max = 228 mg/l).

NOV was sent 8/24/2009 cert mail:70007 2560 0002 5793 7022. Chapter 102 and 78 violations. MAB

At 18:30 on 5/9/2014 Amber Oyler (PGE) notified the Department about a spill that occurred at the entrance to the COP 322B pad. According to Ms. Oyler, a truck rolled over partially into the roadside ditch spilling 10 gallons of synthetic oil-based drill mud, 2 gallons of engine oil, and 20 gallons of diesel fuel.
Northridge was dispatched to delineate the extent of the spills and remediate. By the following day the area had been excavated (guided by PID) and confirmation samples were collected. The initial spill was confined to the dry ditch on the west side of the access road. No impacts were noted to the ditch or infiltration basin on the east side of the access road.

Spill

On 6/10/2014, I performed an inspection of Mildred Parry's Llyod Strope #41 oil well. The site is located in Springhill Twp., Greene County. The inspection was performed routine inspection of the well site.

The well head is not labeled and the well appears to have a leak in the production fluid holding tank. The soils surrounding the site are stained and vegetation is dead at the site. Soils are stained around the well head and around the production lines on site.

On 11/25/2014, I performed an inspection of Mildred Parry's Lloyd Strope #41 oil well. The site is located in Springhill Twp., Greene County. The inspection was in response to a report of an oil spill at the location.

The well head is not labeled. The well head is leaking oil and gas the soils around the well head are stained and the vegetation is dead. There are absorbent pads around the well head and produciton fluid tank at the well site. A third leak was observed at the oil holding tank near Mt. Carmel Rd. Absorbent pads where also on the ground around this holding tank. Oil was observed at the well head, produciton fluid tank near the well and the oil holding tank near the road discharged on the ground.

Absorbent pads where also on the ground around this holding tank. Oil was observed at the well head, produciton fluid tank near the well and the oil holding tank near the road discharged on the ground.

On 5/29/2014, I performed an inspection of Parrys Garage Inc. Jim Parry#1 oil well. The site is located in Richhill Twp., Greene County. The inspection was performed in response to an emergency spill report by Greene Co. Emergency Response.

At 0800, the operator had begun transfering oil from the holding tank on site to the load out point along Long Run Rd, when it was noticed that the drain line was broken and leaking oil into Long Run. The landowner of the property had dug the soil near the stream and drain line and broke the line. Approx. 265 gallons of crude oil was discharged from the line into Long Run. The oil traveled approx. 4,225' along Long Run. Greene Co. Emergency response with help from Weavertown Environmental Group placed booms in the creek capturing the oil and Weavertown was going to proceed removing the oil from the surface of the water.

both pit liners were torn and regressed within the pit, IW dis to the gnd, frbrd not maint,

Drilling had been completed at the time of the inspection. The well was not equipped for production. The following deficiencies were found at this site: 1- The site was not constructed according to the E&S plan that was on-site. Because this site has a waiver, the approved E&S plan should be followed and any changes should be discussed with the Department prior to implementation.
2- The grub/brush line was installed on the wrong side of the silt fence.
3- There were several instances of failing filter fence.
4- The access road could use additional BMP¿s to limit the amount of sediment entering the stream.
5- The pit installation that was observed at the site could cause undue stress to the integrity of the pit liner and could lead to a tear.

Spoke with Dan Fluke of Penn View who was on site.
Pit construction was adequate.
E&S controls installed. Access road well maintained.
Well flow back was being returned to the drill pits. A good deal of water was around the well head and made its way off the pad. It was reported as fresh water. A sample was taken (0629722). Analysis of this sample showed inconsistencies with this statement.

Site visit was due to spud notification.
First Class Energy was actively drilling during inspection.
Access road had little to no stone. Mud was being dispersed from the site onto the township road.
Pit was poorly constructed. Liner was punctured with metal posts holding safety fence. Liner was not smoothly or evenly distributed throughout the pit.
Rig was spewing cuttings and mud onto the ground. Rig hand said they hit a "wet spot."
Wade Branan (tool pusher) stated they hit three separate water bearing zones.
E&S controls was poorly installed and not maintained. Sediment laiden runoff was making its way past the silt fence.
Based on E&S plan cuttings cannot be habdled on site due to the seasonal high ground water table.
PA DEP Water Quality Specialist April Weiland was present during inspection.

RTPT inspection conducted in response to inspections IDs 2406224 & 2406226. At time of inspection, well drilled and appears equipped for production. Opr repBrad Little and contractors on-site. Contractors currently plumbing the 2” annular port into the brine tank in response to fluid discharge from this port. Mr. Little believes that “formation water” is leaking out of this port. Mr. Little stated that he was unaware of this issue and is therefore unaware of how long it has been occurring. Mr. Little reports that the water comes out of the port as a “spit” and/or “trickle”.Due to the nature of the discharge (i.e. trickle), the Department was unable to collect an adequate quantity of sample material for standard oil and gas analysis. Mr. Little stated that he intends to collect a sample of the fluid.The Dept informed Mr. Little that a FUI is anticipated to be conducted to observe whether the Opr has properly identified and remediated the discharge.
UPDATE:9/10 Samples collected by Opr on 9/9.
UPDATE: 9/16 Viols issued. Add'l comments on paper SAIR

Crews on-site at time of inspection. Site ID sign and E&S plan located.

Deficiencies noted:
1- Drill pit liner fell into the pit water. The water has over-topped the collapsed pit liner.
2- The water that has over-topped the collapsed pit liner can be classified as an industrial waste discharge.
3- The silt fence on-site was not installed correctly. There is evidence that runoff is under-cutting the silt fence on the lower side of the site.

On July 14, 2014 at about 13:00 Penneco discovered that during the hydrofracturing of their Braddock 12H well it communicated with an old, abandoned well about 1,800 feet west of the Braddock pad. The material pushed out of the old well impacted a stream running past the old well and this material eventually impacted Long Run.
This incident results in several violations.

5/24/2016, I performed an inspection of the Penneco Braddock 9H well site. The site is located in Aleppo Twp., Greene County. The inspection was performed as a site inspection after a reported spill of crude, brine, diesel and xylene mixture by the operator on 5/20/2016.

The operator informed the DEP that during well service activity the well unloaded through the top of the well on 5/23/16. The well discharged approx. 3-4 barrels of crude/brine/diesel and xylene mixture to the ground around the well head. None of the discharge left the well pad. The service crew shut off the well on 5/24/16 and began removing production equipment for site remediation and cleanup. The operator had Matthew Kapral from Woddard & Curran on site directing site cleanup and removal of impacted material from the pad to be disposed of at an appropriate and department approved location. Impacted material was being stored in three sealed roll off boxes, and also in containment and covered on site. The impacted

Access road eroded. Tag, tank, site e&s ok.

Well site appears to be in production. Brine Tank located on-site is in sound condition. During the inspection, several deficiencies were noted:
1- There are deep ruts developing in the access road. These ruts are diverting the water and changing the flow of the run-off. The water is not being directed into the turn-outs. In addition, the ruts make the access road nearly inaccessible.

2- There are no E&S controls located at the culvert. The culvert is located at a low spot and the ruts are directing the run-off directly into the stream. The addition of rock protection and silt fence would greatly decrease the run-off in this location.

Please address these issues and then notify Jarrod Shultz at the address / phone number noted above.

No E&S controls

Drilling had been completed at the time of the inspection. Well appeared to be equipped for production, brine tank onsite and appears to be in sound condition. The site had been regraded at the time of the inspection, however it had not been seed
Well is operating and is in production. Brine Tank located on-site is in sound condition. Several deficiencies were noted while on-site:
1- The lack of vegetation has caused severe erosion and sedimentation.
2- There is off-site transportation of sediment.

After addressing the severe erosion ruts, the site should be seeded and mulched and it may help to prevent future erosion problems if a diversion ditch was installed.

Spoke with operator representative Dan Rice regarding these deficiencies and the problems will be addressed when an agreement can be reached with the landowner.

Site was constructed, drilling equipment located onsite at the time of the inspection, however drilling was not ongoing. 1) Noted that the permit number on the site ID sign is expired. The operator should fix this error as soon as possible. 2) Noted th
Site constructed, drilling was not ongoing at the time of the inspection. Below grade pit located onsite and appeared to have more than the required two-feet of freeboard. The well-site is located within a HQ watershed. 1) Noted that the filter fabric

rilling was completed on 1/24/2008. The operator has exceeded the 9 month period to restore the site to 70% vegetative cover. As a result the operator failed to minimize accelerated erosion and sedimentation. The silt fence at the bottom of the sit
At the time of the inspection, the well was in the process of being drilled. Several deficiencies were noted while on-site:
1- There was a steady flow of mud and water coming down the entrance to the access road. The mud was flowing directly on to the township road.
2- There was evidence of off-site transportation of sediment occurring at more than one location. The first location was at the entrance to the access road. There was also evidence of off-site transportation on the lower corner of the well pad. It appeared that the water was running along the silt fence and then flowing under it and down into the natural ravine below.

Spoke with Dan Rice while on-site and crews immediately addressed the problems.

Drilling completed 11/1/07. Well is equipped for production. Tank sound. Well tag in place.
Access road is stable with no signs of accelerated erosion.

Inspection revealed the following deficiencies:
1) Well site not restored. Site was backfilled and graded to contour, but does not appear to have been seeded/mulched. Site does not have 70% uniform, perennial vegetative cover, and is not stabilized in its present condition. Entire site needs to be seeded/mulched.

Drilling completed 11/4/07. Well is equipped for production. Tank sound. Well tag in place.
Access road is stable with no signs of accelerated erosion.
Inspection revealed the following deficiencies:
1) Failure to minimize accelerated erosion/ failure to stabilize site. There is evidence of erosion (washed out area) running down the slope of the site and through the silt fence that has collapsed on the down-slope side of the site. This area needs to be stabilized, and the silt fence needs to be maintained until final stabilization is achieved.
2) Although this site was seeded/mulched it does not have 70% uniform, perennial vegetative cover, and is not stabilized in its present condition. Entire site needs to be seeded/mulched.

At the time of the inspection, crews were in the process of running the pipeline to the well head. Several deficiencies were noted during the inspection:
1-The current E&S controls at this site are insufficient to prevent erosion and sedimentation from occurring.
2-As a result of insufficient E&S controls, there is off-site transport of sediment. This off-site transport is directly into a nearby wetland / stream.

Operator representative Dan Rice was notified of these findings and crews will be sent to the site to repair and upgrade the E&S controls as soon as possible.

Well is drilled, logging and perforation truck was parked next to well head with equipment being run into well. Water trucks were coming onto location and filling a pit with water. Pit was built up approx. 4ft above ground and lined. Another pit containing drilling fluids ran entire length of pad. Pit had earthen divder, and was lined on one half. This half contained drilling fluids and had greater than 2ft of freeboard. The half that was unlined also cantained about 1' of water that appeared clear with no contaminants. Water is most likely collected rain water or ground water.
The E&S plan and site ID sign were on site. E&S plan had been changed so that culvert on access road was moved approximately 50' closer to pad. Rock construction entrance at end of acces road is inadequate or absecent. Enrance is indicaed on E&S plan, but hwere it is supposed to be installed is muddy and rutted. the access road come outs onto Whiskey Run Rd. Dragout is evident at this intersection. On far end of site, soils are piling up against sed. fence.
Site investigated in response to complaint #264275 (runoff from this site and mining activities were polluting Whiskey Run) Upon inspection of files and site, I found that a well site restoration report has been submitted for this well in Februrary of 20
Site has been restored. Vegetation grew to greater than 70% creating permanent stabilization. Access road to site runs up a steep hill and had signs of accelerated erosion cut across it in a few spots. Upon site visit no issues were occuring, but I

Well has been drilled, E&S controls and original pit are still in place. Since inspection on 7/2/2009 pit liner has been installed. Liner is sound and there is more than 2ft of freeboard in the pit. An additional pit has been constructed for fraccing purposes. This pit is also sound with adequate freeboard and liner.
The following violation was discovered during inspection:
On corner of pad farthest from entrance and closest to main road, concentrated water flow has eroded a small channel under the sediment fence and washed sediments out into a low lying area. The sediments carried as far as 20 ft from edge of pad and pooled creating a mud hole about 6ft in diameter. Company has been asked to clean up as much of the sediments as possible and restabilize slope

Violations to be corrected by 6/30/2001.

Contacted by fax from Herschel McDivitt.
Violations to be corrected by 6/30/2001.

Well site appears to be in production. Vegetation is well established. There is no evidence of accelerated erosion or sedimentation on the access road or well site. However, several violations were noted:
1- The Brine Tank is not structurally sound due to a large hole in the upper part of it.
2- The hole in the Brine Tank creates the potential for a release of fluids into the waters of the commonwealth.

Tag faded but legible. Tank ok. Site e&s ok but access road is heavily rutted and in need of repair.

Tag ok. Site e&s ok except in dead zone. Tank valve appears to have leaked, resulting in discharge.

No action taken by operator to revegetate site. Violation stands.

After arriving onsite I spoke with Randi Mathew and Zach Subra (Range) and we walked the site. Weatherford was onsite conducting active completions operations (perf. and frac.) but was not under pressure at the time of the inspection.
Earlier in the day, brine was discharged into the flow-back tanks causing a mixture of sand and brine to splash outside containment. This release was monitored but flowed under the flow-back tanks. The furthest extent of the release was just south of the containment. Sample 3440187 was collected from a small puddle at the furthest extent of the spill.
On 8/25/2014, I was notified that the previously impacted pad surface had been excavated.
On 8/26/2014, I met with Ms. Mathew and Mr. Subra and we inspected the pad location. Two coiled-tubing rigs were onsite drilling out plugs. The area of the previous spill had been excavated and had soil conductivity between 300-600umhos/cm.
Violations noted and corrected in a timely manner; no response required.

On 8/25/2014, I was notified that the previously impacted pad surface had been excavated.
On 8/26/2014, I met with Ms. Mathew and Mr. Subra and we inspected the pad location. Two coiled-tubing rigs were onsite drilling out plugs. The area of the previous spill had been excavated and had soil conductivity between 300-600umhos/cm.
Violations noted and corrected in a timely manner; no response required.

A review of groundwater monitoring data indicates that impoundment fluids have escaped. Enf addressed under CACP; enf ID 325015

• 1-2 barrels of brine were estimated to have left containment and been partially removed by excavating surrounding material to the extent feasible due to encroaching machinery and equipment not currently able to be moved with the frac job in progress.
o Surrounding soil showed 9420 ¿S conductivity.
• Fluid on secondary containment in the immediate vicinity of the spill showed 13000¿S conductivity.
• Pad surface below containment appeared damp but was not tested for further spilled fluid.
• No indication that the spilled material was spreading or had left the pad.
• Weavertown was reported to have been involved with cleanup efforts.
• Further cleanup delayed for finish of fracking; follow up once frac job complete.
Conclusion:
• Site may need to be referred to environmental cleanup.

• 1-2 barrels of brine were estimated to have left containment and been partially removed by excavating surrounding material to the extent feasible due to encroaching machinery and equipment not currently able to be moved with the frac job in progress.

On March 6th 2015, file review in response to a request for a restoration extension indicated the following:
•The date that all drilling on the Kennedy Unit Pad was completed is 04/22/2012 per state records
Conclusions:
•Due to the date of the request (01/20/2015) being more than nine months after the completion of drilling the site is in violation.

On March 6th 2015, file review in response to a request for a restoration extension indicated the following:
•The date that all drilling on the Midler/Froebe B Unit was completed is 04/20/2012 per state records.
Conclusions:
•Due to the date of the request (01/19/2015) being more than nine months after the completion of drilling the site is in violation.
On March 6th 2015, file review in response to a request for a restoration extension indicated the following:
•The date that all drilling on the Sten Unit was completed is 05/19/2012 per state records.
Conclusions:
•Due to the date of the request (02/09/2015) being more than nine months after the completion of drilling the site is in violation.

there was a location where the pad stone appeared to be removed and the berm refilled. This was later determined to be the result of remediation for a brine spill that occurred on 09/08/14. Coming off of this location is a significantly eroded channel (See photos). This channel appears to be caused by water draining from the pad to the location of excavation and then flowing through the replaced section of berm. Silt Fence sections and silt sock were present in an attempt to stop sediment from being carried downhill, but were unable to do so. Large amounts of sediment had deposited upgradient of each BMP. Water carrying sediment from the site left the LOD and continued down to an intermittent stream and then entered an UNT (see photographs).

On 6/8/2015, I performed an inspection of Range Resources Hibbits to Sportsmn/McDonald TWL site. Present at time of inspection was Hannah McAvoy, and Nate Smiell, Range Resources. Representatives from Tenmile and Keystone Clearwater where present completing remediation of the spill. The site is located in Donegal Twp., Washington County. The inspection was performed as a response to a reported clarified brine spill by the operator.

The operator intially reported a spill of 15 gallons of reuse water from the TWL, being operated by Keystone Clearwater, during bleeding of air from a pressure release valve. After further investigation and site conditions the spill was larger than 15 gallons. The spill occurred on the Range Resources DMC Properties well pad. The brine water pooled on the well pad and then left the well pad and traveled approx. 100' down the well pad slope. The operator was on site with excavting impacted
Spill Response inspection; 6/9/2015. At 12:00, Zachary Subra (Range) reported the release of an unknown volume of brine/reclaimed produced water on the well pad. At 12:50, I arrived onsite and met with Mr. Subra. Baker Hughes was onsite pre

During well stimulation of well 37-081-21570 source water was released on and off containment due to a suction line blowing on the blender.
During well stimulation of well 37-081-21570 source water was released on and off containment due to a suction line blowing on the blender.
During well stimulation of well 37-081-21570 source water was released on and off containment due to a suction line blowing on the blender.

On 6/16/15, I inspected the Gulick site in response to an operator reported incident and made the following observations:
•The operator reported and E&S failure related to severe rainstorms in area. Storm water and some sediment overtopped the perimeter CFS and left the site LOD; some material entered an immediately adjacent wetland.
•Large amounts of rainfall on a topsoil pile focused rain and sediment onto a small area of CFS resulting water and sediment leaving the site LOD and entering an adjacent field and wetland.
-This release does constitute a violation as the operator failed to implement the earth disturbance in a manner that minimized the generation of increased stormwater runoff.
-Due to timely reporting, immediate cleanup, and limited disturbance outside the LOD this violation is being viewed as immediately corrected at this time.
•At time of inspection the sediment was generally cleaned up using shovels with little damage to vegetation.
•No significant damage was observed to wetland or adjacent streams.
The release was caused when heavy rain washed brine off containment liner which had the berms removed to allow equipment to be removed from the site. At 13:35, I arrived onsite and met with Mr. Subra. Much of the pad previously impacted by
The release was caused when heavy rain washed brine off containment liner which had the berms removed to allow equipment to be removed from the site. At 13:35, I arrived onsite and met with Mr. Subra. Much of the pad previously impacted by

The release was caused when heavy rain washed brine off containment liner which had the berms removed to allow equipment to be removed from the site. At 13:35, I arrived onsite and met with Mr. Subra. Much of the pad previously impacted by
•Rock entrance was constructed and access road was being graveled at the time of inspection.
•E&S controls at previous failure have been repaired and reinforced to prevent further issue including extra sections of CFS, matting, and the addition of a sump.
•Sediment laden water was found to be leaving the site LOD at the site entrance and entering a nearby stream.
-Water appears to be flowing from the cut slope for the access road running under the rock of the construction entrance, circumventing one of the drains at the site entrance, and running down a roadside ditch over a small piece of 8” CFS before entering the stream. See attached pictures.
•Follow up inspection recommended in one to two weeks to check remediation.

On 6/19/15, I inspected the Sten site as a routine inspection and made the following observations:
•Pad berm along south side of pad has insufficient stabilization.
•Site sediment ponds are filled with cattails and appear to be holding water excessively.
•Cut slope on north end of pad has insufficient stabilization.
•The eastern sediment trap has a very large erosion channel leading into it.
-This erosion channel constitutes a violation in that it indicates a significant failure to prevent excess erosion on the site.

Admin inspection for WMP CO&A
Admin inspection for WMP CO&A

Pre-operational inspection in response to an operator request. Water that had collected behind the 24” filter sock located below the sediment basin at the SE corner of the site was of sufficient volume to pass around the edge of the filter sock and fl

At approximately 10:35 an employee discovered the release which was caused when a dump valve was stuck open causing a mist of produced water to be released onto the snow-covered ground below. An area approximately 225'X100' was impacted by the release but an estimate of volume was not available. 2/18/2016: At approximately 08:48 I arrived onsite and met with Randi Mathew (Range). After shoveling, vacuuming, and excavating snow by several means, the area including the fenced pipeline enclosure back to the produced water tanks (release source) had conductivity elevated above what would be considered fresh water or background. Several grab samples within the release area had conductivity between 3,000-5,000 umhos/cm. Based on the evidence, it appears the excavation of the release based on the visual extent was not effective at removing impacted snow. I recommend characterizing the site and following the Department's spill guidance. 5/16/16:Alternate Remediation report acknowledged. Violations corrected.

On 3/9/2016, I performed an inspection of Range Resources DMC Properties well site. Present at time of inspection was Brandon Carson (Range Resources) and Robert Stewart (WEG). Representatives from WEG where present completing remediation of the spill. The site is located in Donegal Twp., Washington County. The inspection was performed as a response to a reported glycol spill by the operator.

The operator intially reported a spill of 50-75 gallons of glycol spilled to the well pad, during setup operations on the glycol unit for the 10H well. After further investigation and site conditions the spill was larger than 50 gallons and is estimated closer to 100 gallons given the holding capacity of the glycol unit. The spill occurred on the Range Resources DMC Properties well pad. The glycol pooled beneath the gylcol unit and was excavated using a vacuum unit. The area was flushed with On 3/9/2016, I performed an inspection of Range Resources DMC Properties well site. At the time of inspection well appears equipped for production. Well tag present and affixed in a permanent manner. During the inspection, Department noted a gas odor and audible hissing sound from the well apparatus. These concerns are being referred to OGI for appropriate follow-up. Department notified Operator via telephone at the time of inspection.

During the inspection, Department also observed what appears to be an area of impact from an older release by the brine tank discharge valve. Brine tank and discharge valve appears to be structurally sound with no active leaks observed at the time of the inspection. The soil, gravel and vegetation beneath the discharge valve and release area visibly stained. Black staining, of the soil, gravel and vegetation from what appears to be a petroleum based release was observed. The impacted soil, gravel and vegetation had an odor characteristic of petroleum. Pooled water at the impacted site had a visible sheen and discoloration. Remnants of what appears to be absorbent powder also observed on impacted area. Release appears to be contained within the well site. Department called Operator and spoke with Doug Tabar and informed him of Department findings. Department inquired if Operator was aware of any recent activity and/or releases associated with this well site. Operator stated that he would check the records and get back to the Department.

On 4/19/16, I performed an incident inspection at the Charles Bello site in response to an operator reported spill (CTS# 319113) that occurred on 4/18/16 and made the following observations:
•Per the operator's initial report roughly 10bbl of reuse water was released to the pad surface, the spill was confined to the pad, and did not impact surface waters.
-The loss of 10bbl of reuse water to the pad surface does constitute a violation of 58 Pa. C.S. § 3217(a) for Failure to control and dispose of brines produced from the drilling, alteration or operation of a well consistent with the Clean Streams Law and 25 Pa. Code § 78.54 for failure to control brine in a manner that prevents pollution of the waters of the Commonwealth.
•The initial report indicates that the spill was caused by overfilling a tank which caused material to be sprayed beyond the secondary containment. Weavertown Environmental Group was reported to have begun remediation on 4/18/16.
•At the time of inspection initial material removal had been completed and tanks were being emptied in order to facilitate further remediation.
On 4/19/16, I performed an incident inspection at the Charles Bello site in response to an operator reported spill (CTS# 319113) that occurred on 4/18/16 and made the following observations:

Well tagged-shut in. Well plumbed into old 7" above ground horizontal surface casing which was full of holes and plugged off near meter. Well not equipped for production. A check in efacts disclosed no production reported for the past 9 years from

Arrived @ 12:24. Weather: hot. This was a routine inspection. There were no personnel on site. There were a total of 5 producing wells, 4 in a linear array and one at some distance from the array. Cellars were gravel filled:
McWilliams 06H – separate from the array of 4 wells. No top gauge. 5-/12": 650 psi (0-1500 psi analog), 13-3/8" x 9-5/8": no combustible gas detected (Altair 5X gas meter calibrated 09/07/16), 9-5/8" x 5-1/2": plumbed to 225-gallon polytank, .no combustible gas at polytank vent.
McWilliams 07H: No top gauge. 5-/12": 650 psi (0-1500 psi analog), 13-3/8" x 9-5/8": no combustible gas detected (Altair 5X gas meter calibrated 09/07/16), 9-5/8" x 5-1/2": plumbed to a shared 225-gallon polytank. no combustible gas at polytank vent.
McWilliams 08H: No top gauge. 5-/12": 620 psi (0-1500 psi analog), 13-3/8" x 9-5/8": 5%/vol combustible gas detected, 9-5/8" x 5-1/2": plumbed to a shared 225-gallon polytank. no combustible gas at polytank vent
McWilliams 09H: No top gauge. 5-/12": 620 psi (0-1500 psi analog), 13-3/8" x 9-5/8": no combustible gas detected 9-5/8" x 5-1/2": plumbed to a shared 225-gallon polytank. no combustible gas at polytank vent.
On 9/28/2016, I performed an inspection of Range Resources Robert Hamilton well site. Present at time of inspection was Nick Reda and Brandon Carson (Range Resources). Representatives from Equipment Transport where present completing remediation of the spill. The site is located in West Finley Twp., Washington County. The inspection was performed as a response to a reported diesel spill by the operator.

The operator reported a spill of a diesel fuel to the Hamilton Well Pad. It is estimated that approximately 60-70 gallons of diesel was released to the graveled pad during loading of produced water, after the water truck experienced an engine runaway. The runaway broke the truck's driveshaft which in turn punctured the fuel tank, resulting in the fuel release.

Liquids from the truck's tank were transferred via another water truck, and the damaged truck was removed. Absorbent pads were deployed immediately following the release, and remediation of the affected gravel / soil was initiated once the truck was moved. The operator was in process of removing impacted material which was being stored in sealed roll-off boxes on site for disposal. Three boxes where noted filled on site and more where being delivered to the site. The operator intends to follow the Department's guidance for Alternative Remediation for this release.

Harbison/Walker Line Unit #122 facility, Pike Twp, Clearfield Cnty. Release of pipeline fluids from an overflowing and leaking tank. Written NOV response requested.
Harbison/Walker Line Unit #122 facility, Pike Twp, Clearfield Cnty. Release of pipeline fluids from an overflowing and leaking tank. Written NOV response requested.
Harbison/Walker Line Unit #122 facility, Pike Twp, Clearfield Cnty. Release of pipeline fluids from an overflowing and leaking tank. Written NOV response requested.
On 11/1/2016, I performed an inspection of Range Resources Hibbits Centralized Impound (Imp. #28) site. Present at time of inspection was Derek Zofchak and Chis O'Connor (Range Resources). The site is located in Donegal Twp., Washington County. The inspection was performed as a response to a reported clarified brine spill by the operator.

The operator reported a release of an unknown amount of reuse water from the Hibbits Centralized Impoundment. During subliner soil investigation activities by the operator, an area of concern was detected via soil conductivity probing. The area of concern was located on the North end of the impoundment beneath the former leak detection zone sump. Civil and Environmental Consultants (CEC) was conducting site assessment activities associated with the closure of the facility during the inspection. The quantity of the release is unknown at this time however the operator has proactively begun excavation and removal of the impacted material. The operator intends to follow the Department's guidance for Alternative Remediation for this release; and will provide a 15-day Notice to the Department.

On February 23, 2016, I performed a complaint inspection at the JW Bell 1 in response to a report of oil entering a stream and made the following observations:
•At the time of inspection the site was in poor repair with multiple pieces of derelict and damaged equipment visibly leaking crude oil and oil based sludge to the ground. Specific incidences are noted below.
-A spring under the building on site appears to be collecting small amounts of oil and carrying them to the stream.
-The larger storage tank appears to have a channel dug or eroded from the valve area leading directly to the stream bank. Blotting the area where the channel enters the stream with oil absorbing cloth indicated substantial oil present.
•The smaller storage tank has no functional cover and is roughly 75% full posing a safety hazard to wildlife and people.
•At the time of inspection the operator had not reported nor taken corrective action in response to any of the above spills or contamination though much of it is years old.
-->See full report for further details.

On February 23, 2016, I performed a complaint inspection at the JW Bell 1 in response to a report of oil entering a stream and made the following observations:

Well is producing.
No well tag.
No tank on site.
Pit on site with 20 mil and 6 mil liners.
Both liners are down in 2 places.
Fluid is over pit liners.
Site not restored within 9 months.
Well is producing.
No tank on site.
No well tag.
Pit on site with 20 mil liner.
Liner is down in the pit.
Site has not been restored within 9 months.

Well is producing.
No well tag.
No tank on site.
Pit on site lined with 20 mil and 6 mil liners.
Less than 2 feet of freeboard on end of pit.
Site has not been restored within 9 months.

Well is producing.
No tank on site.
no well tag.
Pit lined with 20 mil. and 6 mil. liners.
Both liners are down.
Fluid in pit is behind the liners.
Site has not been restored within 9 months.

Producing gas. Tag and site e& sok. Dead zone indicative of a brine discharge near brine tanks.
Producing gas. Tag and site e& sok. Dead zone indicative of a brine discharge near brine tanks.
Approximately 20 bbl Frac Fluid to the ground.

Drill cuttings into an UNT of Stony Run on an HDD for temporary water line crossing (GP051015847).

Access road shared with ag field. Well site fenced and gated. At the time of inspection well appears equipped for production. Site permanently stabilized. No E&S issues in relation to site access road. Well tag present and affixed in a permanent manner.

During inspection, Department observed a steady leak from the discharge valve/flange connection located at the bottom of the brine tank. Area beneath the brine tank near the flange appeared damp, rocks appeared to be stained directly beneath the discharge valve (see photo C). The fluid observed beneath the valve appeared to have a sheen (see photo D). The discharged fluid appeared to be pooling on the ground (see photo E). The Department also observed white crystalline like staining on the rocks, gravel and dirt beneath the area discharging fluids (see photos F, G and H).

On site for a routine partial inspection. Heavy rain event during inspection.

Heavy runoff from culvert pipes is causing E/S control failure along access road. The water is undercutting CFS in the same area as noted in previous inspections. The temporary remedies installed by RE are not functioning and heavy runoff is undercutting CFS in several areas and causing erosion and sedimentation issues off LOD.

The heavy runoff is flowing off LOD, causing erosion of hillside. Water is cutting out hillside and causing subsidence of hillside. Water is flowing downhill and flooding out wetland off LOD and loading it with sedimentation.

On site for a routine partial inspection. Heavy rain event during inspection.

Pipeline in the ground, temp. stab in place. Locations near streams where silt sock not staked in at all, also water bar to ditch, enhanced erosion no controls. Violations were immediately corrected

area of the ground surface that was impacted by the (20) gallon processed water spill that occurred on 3/6/13. PVR completed the excavation of the impacted area of the release and Weavertown collected a sample at the bottom of the excavation. The sample was collected close to the center of the excavation. The dimensions of the excavation consisted of a 10'X10' area. The location of the excavation was in the SE corner of the well pad next to a drainage channel. Mr. Pittenger showed us the 3/8/13 sample results. The Oil and Grease sample measured (2,990) mg/kg. Total Petrloeum Hydrocarbons on 3/8/13 measured (1,490) mg/kg.

ADK-insp of Bense water impoundment, ESCGP-1 08-09-811, found 102.4(b)(1) and CSL 401 viols.

Multiple viols for 3 main issues: (1) Above ground pit -- Improperly lined pit, not structurally sound, drill cuttings on the ground around pit. (2) Deisel fuel spill to the ground. (3) Dusting/land application of cuttings without approval.

Above ground pit on site has less than 2 feet of freboard and is leaking out onto ground, pit has cement returns and oil in it. See Insp ID 1898607 done 7/14/10 at permit 015-20520, past violations closed.
Cuttings on ground, suspect mud also mixed in cuttings, sampled aqueous solution
Eroding Soil, BMPs falling down, trash strewn about the site.

. A review of our records indicate that the required minimum 3 day notification for bulk earth disturbance activity after the installation of all perimeter sediment BMP's was not received. Paragraph 16 of your permits standard conditions clearly states that this is to be done. A review of your construction sequence also clearly states the condition. This inspection qualifies as the required pre-operational inspection.

VIOL ACO 6/3/16 (eFACTS records cleanup). Violation was administrative and three surface activities inspections have been conducted since this INSP/ENF was executed: 2467830 (3/16/16), 2451873 (2/1/16) and 2340897 (1/27/15). All three

The Department was on site at the Talisman Energy Choconut Valley Farms Well Site to conduct a Routine Complete Inspection. The Well Permits issued for this pad are the Choconut Valley Farms (115-21718, 115-21719).

There were a number of areas where the vegetation was sparse to non-existant, and one area where plastic piping was occluding the drainage ditch for the pad.

I chose the following photos to represent the site, however there are a number of areas covering most of the site that are extremely low vegetation and they all need to be addressed.

Photo 1. Below the entrance to the Corey Pad, vegetation low, <20%.

Photo 2. Above Corey, below Choconut Valley Farms, vegetation low, <20%.

Photo 3. Sediment Pond, on CVF pad. Vegetation nonexistant.

Photo 4. Pipe blocking drainage ditch.

A significant portion of the site is not stabilized and does not meet temporary stabilization standards.

If there are any questions, feel free to contact me at (570) 346-5539

All VIOLS ACO 6/6/2016 (eFACTS record cleanup). RTNC inspection conducted 2/29/2016 (INSP ID 2462617) concluded as NOVIO. ~CMB~
Kristopher Perritt (Talisman) reported release of produced water to pad surface approximately 15 feet east of 3H well head. Observed stained snow (5'x10') on pad surface. Collected sample 0943204 from stained snow for analysis of SAC 942 me

most recent inspection was conducted on 5/29/16.

The Department noted that there are areas along the slopes on the access road that do not appear to meet temporary stabilization requirements. The Department requests that the operator deploy a method of temporary stabilization that is consistent with your E&S Plan within 3 days of receipt of this report.

In the area where the culvert (STA 18+50,Stream Crossing of the UNT to Choconut Creek -WWF/MF) is, there are rills running down the access road. Sediment laden water is running down these rills, across the road, down the rip rap fill slope, and into the UNT to Choconut Creek. The creek is being impacted with sediment laden water but is running clear upstream from this interference. This is a violation of the Pennsylvania Clean Streams Law. The Department requests that the operator immediately survey this area and make any repairs necessary to achieve compliance.

The creek is being impacted with sediment laden water but is running clear upstream from this interference. This is a violation of the Pennsylvania Clean Streams Law. The Department requests that the operator immediately survey this area and make any repairs necessary to achieve compliance.

The Department was on site to conduct an inspection in relation to a release which occurred on the access road to the Thorne well pad. (ESG13-115-0071)

The wells associated with this pad are as follows:
115-21435
115-21436
115-21437
115-21438
115-21439
115-21440
115-21441
115-21442
115-21443

According to Talisman representative Kris Perritt(email) " A a tractor trailer hauling pipe up to the Kropp had a leak from the radiator. When the driver noticed a problem, he was very close to the Thorne pad entrance off of Cork Hill Road, so he pulled in there. Based on our field tech's observations, approximately 5-7 gallons of antifreeze leaked from the radiator onto the apron of the lease road. A few small stains were noticed on the paved surface of Cork Hill Road as well. After the incident, the trucking company sent laborers to hand shovel the affected soil and stone from the lease road, and apply some speedi-dri to the stains on the road. On Talisman's behalf, Golder Associates went out to note conditions and observe the cleanup. They collected post-excavation samples for glycol field screening and were satisfied that the spilled material was adequately cleaned up. The waste was staged in some spill overpack drums on the lease road and will be disposed off through Elk Environmental once the waste profile is complete. "

The department went out on site on Nov 1, 2016 and determined the spill occurred just off Cork Hill Road and there was no trace of antifreeze left on the ground observed by DEP representative Frank Hoehle. The overpack containers were still on the lease road entrance and the area appeared to be cleaned up in an acceptable and timely manner. While 5-7 gallons of anti-freeze did hit the ground, in violation of the Clean Streams law, it was immediately cleaned up and disposed of properly.

There were no E&S issues on the Thorne site or on the access road and there were no other issues apparent at this time.

Violations immediately corrected.

No response from operator to the 08/08/08 inspection requesting that the operator address the well pad area either with vegetative cover or some otehr acceptable BMP. Site inspection found no action taken by the operator.
SRB-unpermitted wetland encroachment, 25 Pa Code 105.11(a) and 693.6(a) Dam Safety & Encroachment Act, written response requested w/in 10 days. NOV to MBC for input 1/11/10, insp never input upon completion.

Drilling is complete and wellhead has been installed.
Rat hole was not filled before drilling equipment was moved off of location. A drill hole or bore hole used to facilitate the drilling of a well shall be filled with cement, soil, drill cuttings or other earthen material before moving the drilling equipment

Stream crossing for a 10" gathering line for the Voll farm Marcellus Gas Wells. Boring under Little Connoquenessing A small release of bentonite drilling gel was released into Connoquenessing but imeadiately contained and cleaned up. There wa

Violation for approximately 13bbl of production water release to ground within diking.

Found several violations on the pipeline project. Will reinspect with supervisor March 22, 2011.

Responded to company-reported oil spill. Barel of used oil knocked over. Good response after the fact.
Sediment into stream. E&S controls overwhelmed and not maintained. Failure to get a permit for the equipment crossing.
Sediment into stream. E&S controls overwhelmed and not maintained. Failure to get a permit for the equipment crossing.
Did not obtain permits for a stream crossing. Release mud & silt into a stream. E&S plans and controls inadequate.
Pumping stream below the outlet level of the pool. Insp Vio was initially written to the ESCGP. Changed to the OGO. -JD
Pumping stream below the outlet level of the pool. Insp Vio was initially written to the ESCGP. Changed to the OGO. -JD

On 03/13/15 at approximately 1200 hours I conducted a routine complete inspection of the Brova-Shotski pipeline on Dague Hollow Road at approximately 40 6 57.33N -80 5 58.75W. The purpose of this inspection was to determine if RICE had built a gravel access road and pad on their pipeline right of way at this location, which was neither permitted nor approved by DEP. The location was to have a rock construction entrance approximately 50 feet in length, but instead did contain a gravel access road and pad on the pipeline right of way. This is a violation for failure to perform work to specifications.

The location was to have a rock construction entrance approximately 50 feet in length, but instead did contain a gravel access road and pad on the pipeline right of way. This is a violation for failure to perform work to specifications.

On 7/22/15, I inspected the Momma Bear site with WQS Supervisor John Carson as a follow up to a prior inspection and made the following observations:
•The soil stockpile built over the rock lined collection channel constitutes a violation in that it is built contradictory to and in obstruction of the permitted E&S plan and function. The channel also does not appear to have been installed on a consistent downhill grade to the sediment trap. This constitutes a major modification to the site without a permit as it effectively removes the collection channel from function.
•Two slides on the site further obstruct the rock-lined collection channel on the north-eastern side of the pad and have been in place long enough to have grown substantial vegetation. This constitutes a violation in that the E&S controls have not been maintained on the site in compliance with its permit or regulations.
•The rock lined collection channel on the north-east of the pad also ends roughly 30-50 feet from the bottom of... --> See full report for more information.
On 7/22/15, I inspected the Momma Bear site with WQS Supervisor John Carson as a follow up to a prior inspection and made the following observations:

On 10/26/15, I performed a routine complete inspection of the Fowler pad in response to an operator request for a preoperation inspection and made the following observations:
•All requisite documents and signage were present at the time of inspection.
•Perimeter CFS around site was damaged, partially buried, improperly installed, and left gaps of varying sizes in many areas around site.
•A topsoil pile that plans indicated would remain undisturbed and which had no perimeter controls installed around received large amounts of dirt from the construction of the pad. This constitutes a violation in that it was both a failure to implement E&S BMPs and the operator failed to comply with the permit.

Conclusion:
•Preoperation inspection could not be completed as perimeter BMPs were missing, damaged, and improperly installed.

On 10/26/15, I performed a routine complete inspection of the Fowler pad in response to an operator request for a preoperation inspection and made the following observations:
•All requisite documents and signage were present at the time of inspection.

Conclusion:
•Preoperation inspection could not be completed as perimeter BMPs were missing, damaged, and improperly installed.

modifications to the current permit. The following observations were made:
•The stream running parallel to Little Daniels Run Road contained suspended sediment both upstream and downstream from the site which would be expected given the observed stream banks and the ongoing precipitation. The downstream portion exhibited a significant increase in sediment load indicating a direct impact to the stream from materials flowing off the Fowler site. It is suspected that the runoff from the site after entering the culvert is being transported to the stream. This is a direct violation of the Clean Streams Law, 35 P.S. Sec. 691.401.
-->Further details in full report.

On 12/31/15, WQS Supervisor John Carson, Environmental Trainee John Parry, and I performed a follow up inspection at the Fowler Well Site in response to questions raised by the operator in regards to a 12/22/15 violation at the same site and made the following observations:
•The rock construction entrance was observed to have areas where the surface was soft enough for tires to leave distinct depressions indicating insufficient construction which also appeared to be allowing significant track out of materials onto the road. This is a violation...
•The front of the site including a large section of cut slope was missing CFS between the disturbed area and the road/road culverts leading to the nearby stream. This is a violation...

During a compliance meeting in Pittsburgh, on 9/4/2015 with the operator. The operator was informed that upon further investigation the Department determined that the well permit for the JAMES HEROLD A GRE 8H (059-26141-00) expired on 4/2
On 1/27/16, I performed an incident inspection at the Ironman Pad in response to these concerns and identified violations including the following:
•My Inspection indicates that either portions of the initial slide or a new slide are currently outside the LOD and within a stream bed directly impacting an operator delineated stream.
•A sump outlet shown in the plans extending south east from the southern corner of the pad had a pipe extension added conducting it an additional ~50 feet to a CFS dam not shown or redlined on site plans. Water was running under the CFS dam still carrying sediment and then continuing around perimeter CFS, out of the LOD and into the adjacent stream channel.
•In the area where the LOD extends along a spur line NW of the pad a number of hay bales and sections of silt sock have been added in an operator delineated intermittent stream.
•An erosion channel was found extending from the north side of the pad near the spur line into the intermittent stream bed.
-->Further details in full report.
On 1/27/16, I performed an incident inspection at the Ironman Pad in response to these concerns and identified violations including the following:

On 11/18/15, I performed a follow up inspection for the Captain USA site and made the following observations:
•The unstabilized disturbed area just off the pad corner opposite the pad entrance originally observed on 11/9/15 remained unstabilized at the time of inspection. This is a violation of 25 Pa. Code § 102.22(b)(1) in that the operator failed to temporarily stabilize the site within four days of the cessation of work.
•Re-notified operator of issue on 11/19/15, remediation reported to be imminent.

On 3/9/16, I performed a pre-operation inspection at the Baby Bear site in response to an operator request for a pre-op and made the following observations:
•Stacked CFS near coordinates N40°08’42.37” W80°01’27.94” was improperly constructed with all ends butting together at the same location. This is a violation of 25 Pa. Code § 102.11(a)(1), 25 Pa. Code § 78.53, 25 Pa. Code § 102.5(m)(4).
•Multiple pad and access road drains were extended and modified directing flow into a non-permitted constructed rock lined channel leading to the northern wet pond. The operator requested red line change approval at the time of inspection. This is a violation of 25 Pa. Code § 102.5(m)(4) conditions 6e, 6f, & 16a.
•The operator constructed unlined temporary channels diverting and moving water from one section of CFS to another in two separate locations below the western side of the pad. This is a violation of 25 Pa. Code § 102.11(a)(1), 25 Pa. Code § 78.53, and 25 Pa. Code§ 102.5(m)(4) conditions 6e, 6f, 8e, & 16a.
-->Further details in full report..

On 3/9/16, I performed a pre-operation inspection at the Baby Bear site in response to an operator request for a pre-op and made the following observations:
•Stacked CFS near coordinates N40°08’42.37” W80°01’27.94” was improperly constructed with all ends butting together at the same location. This is a violation of 25 Pa. Code § 102.11(a)(1), 25 Pa. Code § 78.53, 25 Pa. Code § 102.5(m)(4).
•Multiple pad and access road drains were extended and modified directing flow into a non-permitted constructed rock lined channel leading to the northern wet pond. On 3/16/2016, I performed an inspection of Rice Energy's Glass Joe well pad site. Present at time of inspection was Jamie Davis (Rice). The site is located in Alleppo Twp., Greene County. The inspection was performed as a routine inspection of the site during construction of the site.

The access road to the site is still under construction. Silt sock and BMPs were observed failing along the access road with a discharge of sediment off site at approx. cross section 35+00. A slope failure along the access road has also observed which caused the BMPs to fail dishcarging sediment off site at approx. cross section 45+00. The operator has left the LOD and conducted earth disturbance activity at approx. 28+00 along the access road in the area of the under review ESCGP 2 permit for the Great Tiger site.

On 3/16/2016, I performed an inspection of Rice Energy's Glass Joe well pad site. Present at time of inspection was Jamie Davis (Rice). The site is located in Alleppo Twp., Greene County. The inspection was performed as a routine inspection of the site during construction of the site.

The operator has left the LOD and conducted earth disturbance activity at approx. 28+00 along the access road in the area of the under review ESCGP 2 permit for the Great Tiger site.

On 3/8/16, I performed a follow up inspection with DEP engineer Emmanuel Nwaobilo for the Captain USA site in response to an ongoing issue with site E&S controls and made the following observations:
•Along the access road, where it crosses the last saddle before the pad, E&S controls have been heavily reinforced partially in response to department recommendations.
•Inspection of the area below the reinforced controls found multiple streams and waterways not shown in the site plans or in the original streams and wetlands report for the site. Due to this the site is not in compliance with §102.4(b)(4)(ii),(iv), §102.8(b)(2),(3),(5), and (8), §102.4(b)(5)(v) and §102.5(m)(2)(ii).
•Many of the stream channels in the area adjacent to the site appear to be undergoing increased erosion and sedimentation. This is a violation of §102.2(a), (b); §102.11(a)(1),(2) and 35 P.S. § 691.401
•The site was also noted to be in in the drilling/PCSM phase at the time of inspection and primary site construction was completed the previous summer. PCSM controls were not constructed with no visible indication found that they were in progress of being implemented. This is believed to be a primary factor in the increased runoff from the site. The failure to construct PCSM controls in a timely fashion is a violation of §102.2(a), (b) and §102.5(f).
•The above additionally constitute a failure to comply with the terms and conditions of the ESCGP violating 102.5(m)(4).
On 3/8/16, I performed a follow up inspection with DEP engineer Emmanuel Nwaobilo for the Captain USA site in response to an ongoing issue with site E&S controls and made the following observations:
•Along the access road, where it crosses the last saddle before the pad, E&S controls have been heavily reinforced partially in response to department recommendations.
•Inspection of the area below the reinforced controls found multiple streams and waterways not shown in the site plans or in the original streams and wetlands report for the site. Due to this the site is not in compliance with §102.4(b)(4)(ii),(iv), §102.8(b)(2),(3),(5), and (8), §102.4(b)(5)(v) and §102.5(m)(2)(ii).
•Many of the stream channels in the area adjacent to the site appear to be undergoing increased erosion and sedimentation. This is a violation of §102.2(a), (b); §102.11(a)(1),(2) and 35 P.S. § 691.401
•The site was also noted to be in in the drilling/PCSM phase at the time of inspection and primary site construction was completed the previous summer. PCSM controls were not constructed with no visible indication found that they were in progress of being implemented. This is believed to be a primary factor in the increased runoff from the site. The failure to construct PCSM controls in a timely fashion is a violation of §102.2(a), (b) and §102.5(f).
•The above additionally constitute a failure to comply with the terms and conditions of the ESCGP violating 102.5(m)(4).

•The above additionally constitute a failure to comply with the terms and conditions of the ESCGP violating 102.5(m)(4).
On 6/16/2016, I performed an inspection of Rice Energy's Jacobs well pad site. Present at time of inspection was Jared Holman (Rice Company Man). The site is located in Gray Twp., Greene County. The inspection was performed as a incident inspection related to a reported brine spill by the operator.

The operator reported a spill of approx. 1 barrel of produced water off of containment to the well padon 6/3/16. I met w/ Jared Holman, the Rice Drilling Consultant on site to review the incident. Mr. Holman stated that Rice personnel had removed impacted material from the well pad for disposal. Cudd Energy Services where on site completing coil tubing operations on the Jacobs 11H well, when a produced fluid line had ruptured and discharged produced fluid to the secondary containment on site. Cudd did not report this spill to containment and then parked a truck on the containment berm causing the produced fluid to discharge on the well pad. During the inspection water was observed pooling in the secondary containment at the location of the 6/3/16 spill. The water in the containment was inspected using a conductivity meter, which had a conductivity of 2.8 mS. Using a soil probe in the excavated impacted material location, conductivity readings ranged from 3.0 mS - 5.8 mS.

Rice is recommended to move any equipment, and immediately begin a full site characterization to determine the extent of contamination resulting from the brine spilled to the site. Any remediation activities should be conducted in accordance with the Department’s Technical Guidance Document titled, Addressing Spills and Releases at Oil and Gas Well Sites or Access Roads (document number 800-50000-001). Rice is also recommended to monitor any nearby receptors such as streams,

On 6/23/2016, I performed an inspection of Rice Energy's Piston Honda well pad site. The site is located in Aleppo Twp., Greene County. The inspection was performed as a routine inspection of the site during construction.

The access road to the site and site are still under construction. The BMPs on location have failed in multiple locations along the LOD. Sediment has left the LOD and discharged into an unnamed trib. to Harts Run. Sediment has also left the LOD and discharged into the road side drainage ditch for Morford Rd., a township road, causing the roadside ditch to fail. Elite personnel where on site continuing maintenance of the BMPs at time of inspection.

On 7/11/2016, I performed an inspection of Rice Energy's Polar Vortex well pad site with Will Brogan and Samantha Sullivan (DEP). Present at time of inspection was Jamie Davis (Rice), Ralph Baumgart (Rice), Mike Benson (Dieffenbauch & Hritz), and Vince Attardi (Dieffenbauch & Hritz). The site is located in Jackson Twp., Greene County. The inspection was performed as a routine inspection of the site during construction.

The operator has begun tree clearing activity at the site for start of construction. The entrance to the site was under construction with stone being placed on the entrance to the access road. AARCON is constructing the site for Rice and has placed a CONEX storage unit with in 50' of Garner Run. The operator was informed that the CONEX would need to be moved outside the 50' barrier to the stream channel. The operator stated that the CONEX unit would be moved immediately.

During the inspection two small wetlands were identified which the operator failed to delineate and identify on the ESCGP 2 permit within the proposed LOD. The two small wetlands where identified and preliminarily delineated by DEP, Rice and D&H personnel. The operator shall completed a second review of the site to identify and delineate all surface water features which might be impacted by earth disturbance activity on site.

On 7/11/2016, I performed an inspection of Rice Energy's Polar Vortex well pad site with Will Brogan and Samantha Sullivan (DEP). Present at time of inspection was Jamie Davis (Rice), Ralph Baumgart (Rice), Mike Benson (Dieffenbauch & Hritz), and Vince Attardi (Dieffenbauch & Hritz). The site is located in Jackson Twp., Greene County. The inspection was performed as a routine inspection of the site during construction.

The two small wetlands where identified and preliminarily delineated by DEP, Rice and D&H personnel. The operator shall completed a second review of the site to identify and delineate all surface water features which might be impacted by earth disturbance activity on site.

On 8/5/16, I performed a second complaint inspection at the Wiggin Out site in response to complaint 321416 accompanied by WQS Supervisor John Carson and made the following observations:
•Inspection of the complainant's spring and collection area found sediment and other indications that runoff from the site had directly impacted the complainant's water supply. A temporary water supply was requested from the operator.
•Runoff water and sediment from the site was found to have traveled around 100 yards outside the LOD from the breached perimeter controls found during the 8/1/16 inspection before entering the spring and stream system immediately downslope from the wet pond. This constitutes a violation of 35 P.S. § 691.401, 25 Pa. Code § 78.53, 25 Pa. Code § 102.4(b)(1), and 25 Pa. Code § 102.11(a)(1).
•Inspection of the wet pond area found that all perimeter controls had been repaired and temporary stabilization had been implemented.
On 8/5/16, I performed a second complaint inspection at the Wiggin Out site in response to complaint 321416 accompanied by WQS Supervisor John Carson and made the following observations:

•Inspection of the wet pond area found that all perimeter controls had been repaired and temporary stabilization had been implemented.
On 9/16/2016, I performed an inspection of Rice Energy's Great Tiger well pad site. Present at time of inspection was Jamie Davis (Rice). The site is located in Aleppo Twp., Greene County. The inspection was performed as a routine inspection of the site during construction, in response to a notification by the operator that the site had BMP failures after a precipitation event on 9/14/16.

Tree clearing activity has just been finished on site. The operator has completed installation of all the perimeter silt sock and the operator is beginning to bring excavation equipment to site, to begin installation of the sediment basins on site. The BMPs on location have failed in two locations along the LOD. Sediment and woody debris has left the LOD and discharged into an unnamed trib. to Mudlick Fork. Approx. 600' of the stream channel was impacted by the BMP failure. Aarcon personnel where on site completing maintenance of the BMPs and removal of debris from the stream channel at time of inspection.

On 9/16/2016, I performed an inspection of Rice Energy's Great Tiger well pad site. Present at time of inspection was Jamie Davis (Rice). The site is located in Aleppo Twp., Greene County. The inspection was performed as a routine inspection of the site during construction, in response to a notification by the operator that the site had BMP failures after a precipitation event on 9/14/16.

inspection of the site during construction.

The BMPs on location have failed in multiple locations along the LOD. The operator had consultants on site performing BMP maintenance at time of inspection. Sediment has left the LOD and discharged into Garner Run. The cut slope along the access road has failed impacting the collection ditch along the access road. The operator will need to perform maintenance on the collection ditch to clear the obstruction.

the site after construction of the site.

The access road to the site is has been completed and accelerated erosion was noted at the down gradient from the rock apron for two discharge points associated with the road side collection ditch. The erosion was document outside the LOD for the site and has impacted a hunting access road on the neighboring property.

Two wells have been spuded on the site at this time, the 1H and 3H wells.

On 8/25/16, I performed a follow up inspection at the Lusk in response to issues found relating to complaint 319254 and made the following observations:
•Significant modifications were found to have been made in the construction of the site entrance without appropriate permits or DEP approval including the following:
-A gravel pull off was constructed that extends beyond the permitted site limit of disturbance (LOD) and substantially increased impermeable surface directly adjacent to the road. This construction constitutes a violation of 25 Pa. Code § 102.5(m)(4) for failing to comply with the terms of the permit constructing a major modification without a permit.
-An unpermitted grated catch basin was installed and connected to the drain crossing under the road which was constructed contrary to permitted site plans and outside the site's permitted LOD. This construction constitutes a violation of 25 Pa. Code § 102.5(m)(4) for failing to comply with the terms of the permit constructing a major modification without a permit.
•The site plans do not show the driveway of the property directly across the street from the site entrance which is impacted by the flow of water from the site entrance. This constitutes a violation of 25 Pa. Code § 102.4(b)(5) in that it is a failure to show necessary surface features in in the site plans.
•The water leaving the site via the drain pipe under the road is noted to be causing extensive erosion outside of the site's LOD. This constitutes a violation of 25 Pa. Code § 78.53, 25 Pa. Code § 102.4(b)(1), and 25 Pa. Code § 102.11(a)(1) for a

During the review of the permits, reviewers noted that aerial imagery showed a stream that was not identified on the Shotski to Fourway or Brova to Shotski plans. This stream was shown on the Shotski to Fourway plans with an existing culvert only in the wetland delineation report.

It was discovered that a stream did exist that was not shown on the ESCGP drawings for the Brova-Shotski pipeline. This is a violation of 102.4(b)(5)(v) for failure to identify all surface water features that may receive runoff on E&S plans.

This stream had been piped through an unpermitted, makeshift culvert consisting of a combination of a 12" HDPE waterline and approximately 6" black corrugated plastic drain pipe. The makeshift culvert was approximately 138' in length and drained a wetland under Rice's right of way to a separate culvert crossing under Wherry Road. Riprap had been placed on the influent and effluent ends of the pipe for energy dissipation. This is a violation of 105.11 for failing to obtain an

On 12/2/15 WQS Bryon Miller and I performed a routine partial inspection on the Haywood to M3 Pipeline and made the following observations:
•Construction equipment accessing pipeline north of Butsko road tore through gabion basket retaining wall and created a large disturbed area that was left with no controls in place. Sediment and water left the site and entered the public roadway and roadside ditch. This constitutes a violation in that the operator failed to implement and maintain E&S controls and failed to comply with the terms of the ESCGP.
•Construction south of Butsko road was missing perimeter CFS shown in plans along the downhill side of the disturbed area for more than a hundred feet. This constitutes a violation in that the operator failed to implement and maintain E&S controls and failed to comply with the terms of the ESCGP.
•No operator personnel were on site at the time of inspection. No work was actively being conducted. No violation.
-->Further details in full report.

On 8/3/2016, I performed and incident response inspection at the Haywood to M3 Pipeline site near the Butsko Road crossing in response to an incident report from the operator and made the following observations:
•Two separate areas were found to have slipped roughly halfway up the hill on the creek side of Butsko road. The slides appear to have been nearly fluid material and proceeded directly out of the site LOD destroying perimeter controls in the process. A large amount of material was deposited in the wooded flood plain below the pipeline right of way, no impact was observed to the Waters of the Commonwealth. This constitutes a violation of 78.53, 102.4(B)1, and 102.11(A)1 by failing to design, implement, and maintain the site E&S BMP's in such a manner that it prevented and minimized erosion and sedimentation.
•The operator reported that the area of the slide received roughly five inches of rain immediately preceding the slide.
•At the time of inspection filter fence had been place around the edge of the deposition area of the slide to prevent the further spread of materials outside the LOD.
On 8/3/2016, I performed and incident response inspection at the Haywood to M3 Pipeline site near the Butsko Road crossing in response to an incident report from the operator and made the following observations:

•At the time of inspection filter fence had been place around the edge of the deposition area of the slide to prevent the further spread of materials outside the LOD.
On 12/29/16 I performed an FUI inspection of the Lusk to Blue Moon Pipeline in response to an inspection of the nearby Lusk well pad that indicated the potential existence of mine waste buried along the pipeline route and made the following observations:
•Tracking throughout the pipeline section from McGirts Road to Elm Road was largely running parallel to the slope resulting in numerous small erosion channels. The erosion channels did not leave the site or cause additional BMP failure.
•The southern side of the stream crossing was found to be the site of multiple BMP failures as well as the improper construction of some BMPs in the area. Three water bars are constructed on the steep hillside running downhill. Two water bar ends without sump or other redirection of the water and the other ends with only a small section of narrow CFS greatly reducing their effectiveness. The grading of the slope below the bottom end of the water bars forms a steeply angled bowl further channeling water towards the silt fence around the stream crossing. Additionally, water and sediment from the site was found to have overflowed around the silt fence and created an erosion channel leading directly into the stream a short distance away. Both the presence of the erosion channel and directly observed sediment in the stream at the entry point demonstrate impact to Waters of the Commonwealth. These issues constitute violations to 35 P.S. § 691.401, 25 Pa. Code § 78.53, 25 Pa. Code § 102.4(b)(1), and 25 Pa. Code § 102.11(a)(1) in that the operator failed to appropriately design, implement, and maintain site BMPs resulting in discharge of pollutants to the Waters of the Commonwealth. The violations were immediately corrected.
•While no dead vegetation or other direct evidence was found indicating the presence of hazardous mine wastes buried in the area a number of sections of rusted metal pipe and other scrap were found north of the stream crossing. Caution and

Additionally, water and sediment from the site was found to have overflowed around the silt fence and created an erosion channel leading directly into the stream a short distance away. Both the presence of the erosion channel and directly observed sediment in the stream at the entry point demonstrate impact to Waters of the Commonwealth. These issues constitute violations to 35 P.S. § 691.401, 25 Pa. Code § 78.53, 25 Pa. Code § 102.4(b)(1), and 25 Pa. Code § 102.11(a)(1) in that the operator failed to appropriately design, implement, and maintain site BMPs resulting in discharge of pollutants to the Waters of the Commonwealth. The violations were immediately corrected.
•While no dead vegetation or other direct evidence was found indicating the presence of hazardous mine wastes buried in the area a number of sections of rusted metal pipe and other scrap were found north of the stream crossing. Caution and
On 12/29/16 I performed an FUI inspection of the Lusk to Blue Moon Pipeline in response to an inspection of the nearby Lusk well pad that indicated the potential existence of mine waste buried along the pipeline route and made the following observations:
•Tracking throughout the pipeline section from McGirts Road to Elm Road was largely running parallel to the slope resulting in numerous small erosion channels. The erosion channels did not leave the site or cause additional BMP failure.
•The southern side of the stream crossing was found to be the site of multiple BMP failures as well as the improper construction of some BMPs in the area. Three water bars are constructed on the steep hillside running downhill. Two water bar ends without sump or other redirection of the water and the other ends with only a small section of narrow CFS greatly reducing their effectiveness. The grading of the slope below the bottom end of the water bars forms a steeply angled bowl further channeling water towards the silt fence around the stream crossing. Additionally, water and sediment from the site was found to have overflowed around the silt fence and created an erosion channel leading directly into the stream a short distance away. Both the presence of the erosion channel and directly observed sediment in the stream at the entry point demonstrate impact to Waters of the Commonwealth. The operator informed the DEP that a slope failed after a rainfall event on 3/3/15 causing a slide. The cut slope and fill area along the pipeline construction failed causing a discharge of sediment outside the LOD across Muddy Hollow Rd., causing the road to be closed temporarily. The sediment traveled down gradient and entered an unnamed trib. to Webster Run. The operator was on site during the site visit with personnel from Precision Pipeline, the construction company removing slide material from Muddy Hollow Rd., to reopen the road.

The operator informed the DEP that a slope failed after a rainfall event on 3/3/15 causing a slide. The sediment traveled down gradient and entered an unnamed trib. to Webster Run. The operator was on site during the site visit with personnel from Precision Pipeline, the construction company removing slide material from Muddy Hollow Rd., to reopen the road.

3/16/2015, I performed an inspection of Rice Poseidon Midstreams Alpha to Tetco pipeline site. The site is located in Jackson and Center Twps., Greene County. The inspection was performed as a routine site inspection.

The cut slope along the pipeline construction failed causing a slide outside the LOD across Pettit Rd., causing the road to be closed temporarily. The slide material entered the pipeline ROW, but the slope failure up slope of Pettit Rd. caused the road to buckle and slide. The operator had personnel on site assessing the damage to Pettit Rd., and remedial actions needed to stabilize and reconstruct the road.

3/16/2015, I performed an inspection of Rice Poseidon Midstreams Alpha to Tetco pipeline site. The site is located in Jackson and Center Twps., Greene County. The inspection was performed as a routine site inspection.

35 P.S. § 691.401

35 P.S. § 6018.301

On 04/21/15 at approximately 1030 hours I along with Environmental Group Manager Dan Counahan, WQS Supervisor John Carson, and DEP Biologist Michael Stephan conducted an inspection of the Golden Goose to Brova pipeline and made the following observations:

It is the DEP's belief RICE has impacted a stream by redirecting its flow from the original channel. This stream is now flowing through the work site to the dewatering structure redlined by RICE without DEP approval.

The site contains BMP's that are in place outside of the Limit of Disturbance. This is a violation for failure to perform work to specifications.

The E&S plans for the site do not contain drawings indicating the aforementioned impacted stream. This is a violation for failure to include this stream on E&S drawings.

5/4/2015, I performed an inspection of Rice Poseidon Midstream's proposed Burnfield Metering Pad site. The site is located in Jefferson Twp., Greene County. The inspection was performed as a follow-up routine site inspection and construction meeting with Tom Joseph, Tae-Uk Kim, and Emmanuel Nwaobilo (DEP). Tonya Winkler, Kyle Shirey, Andy Campbell, Jeremy Burden, Matt Fahey, and David Adams were present on site from Rice Poseidon Midstream. The O&G Technical Services Section had conducted a previous site visit on April 24, 2015 as part of their review of a pending ESGCP-2.
The site has been partially constructed without an approved permit.

On 6/12/15, I inspected the Mama Bear to Shotski pipeline in response to a report of an inadvertent return and made the following observations:
•According to operator drilling mud was found to be reaching the soil surface in a nearby wetland, the release was estimated at 30 gallons.
  oThis return does constitute a violation in that the operator failed to control drilling muds in a manner that prevented pollution to the waters of the Commonwealth.
  oThe incident was discovered at approximately 6:30pm on 6/11/15 and was reported to the DEP at 6:54pm, clean up was stated to have begun immediately.
•At the time of inspection the cleanup was completed and appeared to be in compliance with department policy.
•Disturbance to wetland was limited to residual amounts of drilling mud on the grass.
•Surrounding wetland area and adjacent stream showed no indication of environmental impact from spill at time of inspection.

7/7/2015, I performed an inspection of Rice Poseidon Midstreams Whipkey to Tetco Pipeline site. The site is located in Richhill and Center Twps., Greene County. The inspection was performed as a routine site inspection during construction of the site. Chris Lowry (Team), consultant, was present on site for Rice Poseidon Midstream.

The operator has begun to construct the pipeline. After discussion with, Mr. Lowry, the consultant on site it appears that the operator has dismissed the primary contractor constructing the pipeline and that contractor had left the site approximately one month prior to the inspection. The BMPs on location have failed in multiple locations along the pipeline ROW. Sediment has left the LOD and discharged into several streams and 2 private ponds along the path of the pipeline. It appears there has been minimum maintenance on the BMPs given the recent precipitation. Sediment was observed in unnamed tribs. to Polen Run, Whitethorn Run, and Jacobs Run.
7/7/2015, I performed an inspection of Rice Poseidon Midstreams Whipkey to Tetco Pipeline site. The site is located in Richhill and Center Twps., Greene County. On 07/10/15 at approximately 0945 hours I conducted a routine partial inspection of the Golden Goose to Brova pipeline off of Dague Hollow road. Upon arrival on site I witnessed a work crew pumping sediment laden water from around a pipeline riser into the headwaters to a stream. This water flowed through the installed HDPE pipe and impacted the stream on site. This is a violation for pollution to waters of the Commonwealth. Upon observing the violation I informed the work crew and they shut down the pump.

Additional BMPs consisting of a drainage ditch and silt sock had been added without department approval. It is highly recommended that these BMPs be removed. The triple stack on site was improperly maintained and there was sediment

On 7/7/15, I inspected the Waterboy to Pollock Pipeline Spill in response to an industry reported incident and made the following observations:
•Per the operator, during pressure testing of a waterline carrying water sourced from the Tuna 1 Pump station (water from the Monongahela river) a fitting in the line failed allowing water to leave the site and enter a nearby stream. Estimates at the time of the spill were of a loss of roughly 20,000 gallons of water, refilling the pipe after fixing the failure required roughly 80,000 gallons.
•At the time of inspection CFS had been installed at multiple points along the path of the flow preventing excess sediment from reaching the stream.
•Roughly ½ mile downstream from the spill live aquatic life including small minnows was observed in the stream, they did not show any signs of distress.

On 07/10/15 at approximately 1030 hours I conducted a complaint inspection of the Waterboy to Pollock pipeline along Rankin Road. On site I met with Dave Adams, Construction Supervisor for Rice Poseidon Midstream LLC, to discuss issues at th

9/17/2015, I performed an inspection of Rice Poseidon Midstreams (RPM) Whipkey to Tetco Pipeline site. The site is located in Richhill and Center Twps., Greene County. On site at time of inspection was Carey Bell (RPM) and Kris Lowry (Team) The inspection was performed as an incident response related to a report by the operator of a inadvertent return (IR) of drill mud to surface.

The operator reported an inadvertent return of drill mud along Jones Rd. at 11:30 a.m., which impacted an unnamed trib. to Whitethorn Run. The operator reported approx. 90 gallons of drill mud returned to surface with a small amount entering the stream. During the site inspection is was noted a minimal amount of mud reached the stream channel with no impacts to the stream. The operator has located the IR discharge point which was an apparent drain tile installed by the landowner.
9/17/2015, I performed an inspection of Rice Poseidon Midstreams (RPM) Whipkey to Tetco Pipeline site. The site is located in Richhill and Center Twps., Greene County. 10/29/2015, I performed an inspection of Rice Poseidon Midstreams (RPM) Whipkey to Tetco Pipeline site. The site is located in Richhill and Center Twps., Greene County. On site at time of inspection was Kris Lowry (Team). The inspection was performed as a routine inspection of the site due to a request by the operator for guidance on site reclamation.

The cut slope along the pipeline construction failed causing a slide outside the LOD. The slide material entered the pipeline ROW, but the slope failure occurred up gradient of the pipeline ROW. The operator plans to complete reclamation of the pipeline ROW in the near future at this site, and will need to exist the LOD to repair the earth movement and slide.

At the time of inspection, well was drilled not in production, currently on inactive status. Dept received restoration report February 2010. Well site had not been completely restored as of this inspection. Drilling was completed on March 1, 2009; therefore, site was not restored within nine months of completion. Pad was rocked, pits were removed, but area not been seeded or mulched; therefore, 70% successful vegetative growth was not observed. Bmp filter sox¿s were surrounding site and functioning as a temporary bmp no accelerated E&S issues were noted. Observed soil pile had not yet been removed, but was stabilized.
Note letter of extension on restoration was submitted to dept but was denied.

A routine inspection of the DCNR 007 1V well site in Tioga County, Shippen Township was conducted on May 2, 2012. The last inspection documented on behalf of Seneca was listed as 4/3/2013. The pad surface was partially stabilized, approximately 60% stone and 40% dirt. Several puddles were observed and tested; none exhibited elevated conductivity. The slopes around the pad were vegetated in some area and bare soil in other areas.
Violations cited for failure to stabilize, failure to maintain E&S BMPs and failure to restore within nine months of completion of drilling. - MRN

Department has not been provided a key to access Seneca Resources' sites. An attempt to contact the operator was unsuccessful due to lack of cell service.

Failure to provide free and unrestricted access constitutes a violation of Section 3258(b) of 58 Pa.C.S. §§ 3201-3274 (relating to Development) ("2012 Oil and Gas Act") which requires the owner, operator or other person in charge of a property, facility, operation or activity under this chapter, upon presentation of proper identification and purpose either for inspection or to remediate or otherwise respond to a well control emergency, by agents or employees of the department, shall provide free and unrestricted entry and access. I departed the site @1130 hours.

Inspection conducted in response to requested wetland delin being submitted by operator. Delin and followup inspection documented wetland encroachment.

Howard Drilling Co. drilling 6 1/4" hole @ 2042'w/ air and dusting.
Pit lined and freeboard maintained.
Four violations noted.
Discussed w/operator rep. Dave O'hara.

Well producing fiberglass tank on site.
Pit on site with 20 mil. liner.
Pit liner has holes in it. Pit liner is down in pit. Pit does not have
two feet of free board.
Pit has been open for longer than 9 months. Drilling was completed on 11/5/99.
Brine discharge to ground from leaking tank; E&S OK
No tank onsite. Tag ok. Site e&s ok but access road heavily eroded in places.
Well site i.d. sign and E+S plan are posted on the access road.
Well has been fractured.
Site is muddy and has standing water puddles on the site.
A pit is on site lined with a 20 mil. liner.
There are visible holes in the liner, some below fluid level in the pit and some above.
It appears that fluid level in the pit was high at one time.
Also, it appears that smoe fluid overshot the pit.
Samples were taken for standard analysis 942 of the standing water on site.
NOV letter to follow.

Drill rig is on-site. Site ID sign and E&S plan located. Drill pit appears to be in sound condition. Deficiencies were noted on the access road and well site:

1)- The access road is not draining properly. The culverts have been plowed shut and there is no where for the water to go. The road is almost impassable.

Contacted operator representative Doug Miller. The operator is aware of the problem and it will be addressed right away. Additional rock will be added to the access road and the culverts will be cleared.

Drilling had been completed, well appeared to be equipped for production. Brine tanks located onsite and they appeared to be in sound condition. There was no observed accelerated erosion or sedimentation in relation to the well site or access roa

Well was drilled deeper and did not appear to be equipped for production. Recent snowmelt had saturated the soil but no E&S issues were noted. Pit was lined and had necessary freeboard. Small amounts of drill cuttings were observed off contain

The data that were submitted were compared to the monthly values the company is required to report to the Water Use Data System (WUDS) through GreenPort. During that review it was noted that discrepencies existed.
After further analysis it was determined that on 5 occasions Snyder Brothers Inc. submitted incorrect values to WUDS (see attached breakdown). Section B. of Snyder Brothers Inc.'s approved Water Management Plan requires the operator to submit their total monthly withdrawal values on a quarterly basis through the Department's GreenPort system. As such, these 5 incorrect entires equate to a failure to properly report total monthly withdrawal values, and are violations of their Department approved Water Management Plan

At the withdrawal location, a large floating dock was being used as a support structure for a permantly installed waterline (approximately 12 inch diameter). The withdrawal was not in use but the dock and waterline remained in the water. No operatio

Inspection entered for the purpose of entering Enforcement Record (NOV) for the Gremmel 5H spud under this permit number. The well was spud in 2012 and the well remains conductor-only. Because no additional drilling has occurred since the well was spud in 2012, the well (conductor) is abandoned and should be plugged.

Note: This Inspection Record replaces Administrative Inspection Record 2536466, which has been rescinded. After further investigation, the Department has determined that there are two wells named Gremmel 5H on the Gremmel Well Pad. The original Gremmel 5H was reportedly spud under well permit 115-20774, but was subsequently reported as ORND by SWNPC. SWNPC later submitted a renewal permit application for the Gremmel 5H, but because the Gremmel 5H was listed as ORND a new well permit number was assigned (115-21260). Permit 115-21260 superseded permit 115-20774, even though the wells had two different SHLs. The spud date associated with 115-20774 was then inadvertently carried over to 115-21260, which is currently an Active Well Permit. Therefore, Administrative Inspection 2536466 was rescinded because the Abandoned Gremmel 5H well is the well spud under well permit 115-20774 and not 115-21260 (which has not been spud). CMB 1/6/2017

Follow-up inspection to my 6/21/11 complaint inspection to determine if the ground cover impacted by this leak had grown back following the restoration work completed by Stedmen Energy on 6/21/11. Upon inspection I found the area remained ba

The Department was at the above referenced Steigerwald oil well to conduct an inspection of an oil release. The well is abandoned and has not been in production for approximately 5 years. Dennis Steigerwald was at the site trying to remediate the stream and the soil during this inspection. The Sewickley VFD placed booms and pads in the stream to absorb any remaining product. Siphon or under-flow dams were constructed to mitigate the spill and prevent down-stream migration of the oil. The Department discussed cleanup options with Mr. Steigerwald and asked that he change out the spent booms and pads as needed. Mr. Steigerwald was placing the contaminated soil and the spent booms and pads in a roll-off container waiting proper disposal. He was also asked to remove all the under-flow dams when the cleanup is complete.
The release of a regulated substance to the waters of the Commonwealth is a violation of the PA Clean Streams Law. The violations were noted and immediately corrected.

Inspection conducted with oil & gas inspector Rick Hoover.
Site ID sign in place. Revised E&S plan on site. Well is not equipped for production (shut in on master gate).
Access road stable, with no signs of accelerated erosion.
Inspection revealed the following deficiencies:
1) Failure to properly line pit. - Portions of the pit liner had collapsed into the pit. In one corner of the pit the liner was below the fluid level. In another corner of the pit the liner was tore up, which also extended below the fluid level.
2) Failure to maintain 2' of freeboard in an impoundment. - Due to the above pit liner violation 2' of freeboard was not maintained in the impoundment. With the torn and collapsed liner the impoundment had no freeboard in place.
3) Discharge of industrial waste to the ground. A substantial amount of what appeared to be gel and drill cuttings were found discharged to the ground. Also had a discharge in the form of drilling fluids from the impoundment due to above conditions.
4) Improper landfarming of waste.

E/S controls and BMPs (filter fencing, CFS) in place, single span / structurally sound bridge in place as per plan. Trench boxes utilized w/ pumps. Pipe in place at HDD. Excavating activity ongoing to connect HDD section pipe to rest of pipeline. No water bars installed as per Erosion and Sedimentation Control Plan. HDD pit is full of water from spring runoff to the SE of LOD, this water is being pumped out and into a filter bag off LOD. The filter bag is enclosed in a plastic sheeting and straw bale dam. The filter bag is being overloaded and muddy water is running out of the bag, overloading the straw bale dam and is running downhill to the NW into the Little Connoquenessing Creek. E/S controls failing along right-of-way near Station 441+00 through Station 444+00, this is causing runoff and sedimentation into Little Connoquenessing Creek.
Straw bales used in place of approved E/S controls. These are failing to prevent erosion and sedimentation from leaving LOD.

RC-39 SPA-JJP-031 @ Station Number 444+00
Little Connoquenessing Creek
E/S controls and BMPs (filter fencing, CFS) in place, single span / structurally sound bridge in place as per plan. Trench boxes utilized w/ pumps. Pipe in place at HDD. On site with Scott Lux/DEP for a follow up inspection to the February 25, 2016 inspections of the following resource crossings numbers along this pipeline:

RC-36 SPA-JCJ-003 @ Station Number 432+00
UNT to Little Connoquenessing Creek

E/S controls and BMPs (filter fencing, CFS) in place, timber matting installed over crossing, erosion control blanketing installed along stream bank.
Some water bars installed, but these are diverting water into areas that cannot handle heavy water flow, this is overloading the E/S controls. The E/S controls are failing along pipeline right-of-way near Station 432+00 through Station 434+00.
Muddy runoff, erosion and sedimentation from E/S control failures noted going into UNT.
Straw bales used in place of approved E/S controls. These are failing to prevent erosion and sedimentation from entering UNT and leaving LOD.

RC-38 SPA-KRD-004 @ Station Number 439+00
UNT to Little Connoquenessing Creek
E/S controls and BMPs (filter fencing, CFS) in place, timber matting installed over crossing, erosion control blanketing installed along stream bank. Timber matting does not have sides over stream.
No water bars installed as per Erosion and Sedimentation Control Plan.
Heavy mud and sedimentation from water runoff along right-of-way is building up along E/S controls, this is causing the E/S controls to fail and muddy water and sedimentation is running off the right-of-way into UNT and wetland WPA-KRD-004.
E/S controls failing along right-of-way near Station 438+00 through Station 440+00, this is causing runoff and sedimentation into UNT and wetland WPA-KRD-004.
Straw bales used in place of approved E/S controls. These are failing to prevent erosion and sedimentation from entering UNT and leaving LOD.

On site with Scott Lux/DEP for a follow up inspection of the February 22, 2016 inspections for the following resource crossing numbers along this pipeline:

RC-38 SPA-KRD-004 @ Station Number 439+00
UNT to Little Connoquenessing Creek
E/S controls and BMPs (filter fencing, CFS) in place, timber matting installed over crossing, erosion control blanketing installed along stream bank. Timber matting does not have sides over stream.
No water bars installed as per Erosion and Sedimentation Control Plan.
Heavy mud and sedimentation from water runoff along right-of-way is building up along E/S controls, this is causing the E/S controls to fail and muddy water and sedimentation is running off the right-of-way into UNT and wetland WPA-KRD-004.
E/S controls failing along right-of-way near Station 438+00 through Station 440+00, this is causing runoff and sedimentation into UNT and wetland WPA-KRD-004.
Straw bales used in place of approved E/S controls. These are failing to prevent erosion and sedimentation from entering UNT and leaving LOD.

On site with Scott Lux/DEP for a follow up inspection of the February 18, 2016 for the following resource crossing numbers along this pipeline:

RC-44 SPA-MRT-002 @ station number 493+00.
Little Connoquenessing Creek

Situation on site is the same as February 18, 2016 inspection:

No E/S controls or BMPs installed at stream crossing. No water bars installed as required by Erosion and Sedimentation Control Plan. Plan calls for super silt fencing, compost filter sock, erosion control blank, and a single span and structurally sound bridge and have pumps capable of conveying a flow of 4.439 GPM in addition to a back-up pump on site. No such pump(s) are in place or on site. This is causing erosion and sedimentation into Little Connoquenessing Creek

Situation on site is the same as February 18, 2016 inspection:

No E/S controls or BMPs installed at stream crossing. No water bars installed as required by Erosion and Sedimentation Control Plan. Plan calls for super silt fencing, compost filter sock, erosion control blank, and a single span and structurally sound bridge and have pumps capable of conveying a flow of 4.439 GPM in addition to a back-up pump on site. No such pump(s) are in place or on site. This is causing erosion and sedimentation into Little Connoquenessing Creek

On site with Scott Lux/DEP for a follow up inspection of the February 18, 2016 for the following resource crossing numbers along this pipeline:

RC-44 SPA-MRT-002 @ station number 493+00.
Little Connoquenessing Creek

Situation on site is the same as February 18, 2016 inspection:

No E/S controls or BMPs installed at stream crossing. No water bars installed as required by Erosion and Sedimentation Control Plan. Plan calls for super silt fencing, compost filter sock, erosion control blank, and a single span and structurally sound bridge and have pumps capable of conveying a flow of 4.439 GPM in addition to a back-up pump on site. No such pump(s) are in place or on site. This is causing erosion and sedimentation into Little Connoquenessing Creek

On site with Scott Lux/DEP for a follow up inspection of the February 18, 2016 for the following resource crossing numbers along this pipeline:

RC-44 SPA-MRT-002 @ station number 493+00.
Little Connoquenessing Creek

Situation on site is the same as February 18, 2016 inspection:

Little Connoquenessing Creek

Situation on site is the same as February 18, 2016 inspection:

No E/S controls or BMPs installed at stream crossing. No water bars installed as required by Erosion and Sedimentation Control Plan. Plan calls for super silt fencing, compost filter sock, erosion control blank, and a single span and structurally sound bridge and have pumps capable of conveying a flow of 4.439 GPM in addition to a back-up pump on site. No such pump(s) are in place or on site. This is causing erosion and sedimentation into Little Connoquenessing Creek

Wetland

No E/S controls or BMPs installed for wetland crossing. No water bars installed as required by Erosion and Sedimentation Control Plan. Plan calls for a timber mat(s) or approved equal single span and structurally stable bridge. The timber matting installed at crossing is not spanning wetland but installed directly on top and in wetland. No erosion control blanketing installed as required by the E/S Control Plan. E/S Control Plan calls for Super Silt Fencing to be installed uphill of wetland in Right-of-Way, this is not installed. This is causing erosion and sedimentation into the wetland

Wetland

No E/S controls or BMPs installed for wetland crossing. No water bars installed as required by Erosion and Sedimentation Control Plan. Plan calls for a timber mat(s) or approved equal single span and structurally stable bridge. The timber matting installed at crossing is not spanning wetland but installed directly on top and in wetland. No erosion control blanketing installed as required by the E/S Control Plan. On site w. Scott Lux/DEP for a follow up inspection of the February 18, 2016 inspection for the following resource crossing along this pipeline:

RC-47 SPA-EMT-015 @ station number 511+00
Crooked Creek

Situation on site is the same as February 18, 2016 inspection:

No E/S controls or BMPs along Crooked Creek at crossing. There is a pit with pump out within ten (10) feet of creek without E/S controls. Pump out from pit is pumped to a filter bag in a hay bale enclosure. The filter bag is discharging sediment laden water into Crooked Creek. This is causing erosion and sedimentation into Crooked Creek.

On site w. Scott Lux/DEP for a follow up inspection of the February 18, 2016 inspection for the following resource crossing along this pipeline:

RC-47 SPA-EMT-015 @ station number 511+00
Crooked Creek

Situation on site is the same as February 18, 2016 inspection:

This is causing erosion and sedimentation into Crooked Creek.

RC-41 SPA-JJP-030 @ Station 464+00
Tributary 35000 to Little Connoquenessing Creek
E/S controls and BMPs failing at crossing, this is causing erosion and sedimentation outside of LOD and to enter tributary. Water flowing down Right-of-Way, this is causing accelerated erosion and sedimentation between Station 462+00 through Station 466+00.
No water bars in place as required in Erosion and Sedimentation Control Plan. Four water bars noted between at top of hill East of RC-41. Three of four are blown out by equipment and not functioning. No Erosion Control Blanketing in Right-of-Way as required in Erosion and Sedimentation Control Plan. Heavy mud build up on timber mat crossing, this is creating sedimentation runoff into tributary.

On site for a partial inspection. Wetlands affected by IRs on both sides of W. Brewster Rd are clear of mud.
Area on side of road, along pipeline right-of-way, is not mulched. This is causing sediment laden runoff to leave LOD.
Drainage pipe dam is filled with sedimentation alongside stream. The stream is overflowing into the dam; this has potential to create sedimentation issues in stream.

. The contractor explained that they were filling the 16” HDPE water line with fresh water in preparation of conducting a hydrostatic test of that line, a seam failure occurred which then caused the subsequent release. The line failure occurred appro
On 2/4/14, RETTEW submitted a report to the Department detailing characterization and remedial efforts taken thus far for the above mentioned spill. A Department Oil and Gas Geologist has reviewed the report and has determined that the spill is significant enough to be forwarded to the Department’s Environmental Cleanups and Brownfields Program (EC&B Program). Thus, DTE will be required to either go through the Act 2 Process or the Alternative Remediation Process. Please contact the Department as soon as possible with the process that will be pursued.

. During the inspection, a rain event was occurring along with a snow melt event. The E&S controls in place were being overwhelmed. The contractor was actively identifying and increasing controls. During the inspection, identified 2 obvious drain
Channel 3 does not exist. Flow is currently being directed into the access road ditch.
Channel 1 does not exist.
Channel 4 does not exist.
A large, unplanned top soil pile has been placed on and adjacent to where Channel 4 should be located. There is significantly less than 70% annual vegetation associated with this top soil pile. There is no silt sock located below this top soil pile.
Appropriately sized silt sock needs to be installed down gradient of this pile.
A top soil pile has been added next to Channel 8.
An erosion channel has developed above the cut slope of the access road, probably due to the fact that Channel 4 does not exist.

The Department inspected the SWEPI LP site, the Synnestvedt 878 (ESX10-117-0154) located in Osceola Twp., Tioga Co. on 1/21/2016 @ 1145 hours in response to a spill notification from Rory Hunter, Env. Coordinator for SWEPI LP, received o
The Department inspected the SWEPI LP - Stanley 1106 (ESX10-117-0243) located in Osceola Twp., Tioga Co. in response to notification of a spill by Patrick Bernethy, Environmental/Regulatory Tech from Shell Appalachia. Mr. Bernethy contact th

Inspection of 09/2015 slip site. Additional erosion has occurred. Concentrated runoff has left ROW and created flow patterns in adjacent woods leading to stream. Potential to pollute (35 PA CS 402) exists. Violation immediately corrected.

The Department of Environmental Protection (DEP) inspected the SWEPI LP – Houck L 433 site (ESX12-117-0019) located in Shippen Twp., Tioga Co. on 4/19/2016 @ 1130 hours. Present onsite for the inspection was Matt Bowman, OSR SWEPI

containment. This constitutes a violation of 25 Pa. Code 78.45 (relating to Oil and Gas Wells) against the Watkins 820 23H well, permit #117-21676, based on the laboratory sample results. In accordance with S 78.54 the well operator shall control and dispose of fluids, residual waste and rill cuttings, including tophole water, brines, drilling fluids, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids and drill cuttings in a manner that prevents pollution of the waters of this Commonwealth and in accordance with §§ 78.55-78.58 and 78.60-78.63 and with the statutes under which this chapter is promulgated.

No violations were cited against eh ESCGP or remaining well permit numbers.

the access road. An E&S inspection was last conducted by company personnel on 8/2/2016 with “no change” noted in the comments section. A small erosion channel was visible along the south side of the access road. Silt sock was visible along the access road to the tank pad.

Secondary containment around the produced fluid tank contained a small amount of water with a field tested conductivity of ~700µS/cm. A hose connected the produced fluid tank to a battery of temporary tanks, located on containment, on the NE corner of the pad. Two large puddles were observed between the production equipment and the battery of temporary tanks. Puddle 1 had a field conductivity of 4.17 mS/cm. Puddle 2 had a field conductivity of 3.2 mS/cm. Conductivity was tested with an Eutech Instruments Oakton Multi-Parameter PCSTestr 35. A sample was collected from puddle 1 and submitted to the DEP laboratory in Harrisburg for SAC 942 analysis.

After receiving notification of puddles on the pad surface exhibiting elevated conductivity, SWEPI LP deployed a vacuum truck to the site and completed removal of the standing water from the pad surface the same day. SWEPI plans to proceed with removal of the temporary water tanks and containment over the next week. SWEPI stated they plan to monitor the soil conductivity readings on the pad surface and evaluate the need for additional work. SWEPI plans to notify the WQS if additional soil remediation or water collection is needed. This constitutes a violation of 25 Pa. Code §78.54 (relating to Oil and Gas Wells) against the Cruttenden 846S 24H well, API#117-21725, for failure to control and dispose of fluids, well servicing fluids, oil, production fluids and drill cuttings in a manner that prevents pollution of the water of this Commonwealth. This violation was immediately corrected. I departed the site @ 1415 hours. Please contact me with any questions.

Pipeline preconstruction meeting, when severely eroded channels and multiple failed BMPs were observed and documented. Please see attached pictures for photo documentation of the following E&S issues:

1) An eroded trench, from accelerated stormwater runoff, was observed in the bottom of roadside channel CC2 from ~stations 8+00 to 5+00.
    a. Erosion has occurred on the embankment above the roadside channel CC2 from ~stations 7+00 to 5+00. The Erosion Control Blankets (ECB) failed causing sediment to erode and deposit into the channel bottom.
2) Channel CC9 appears to have experienced gully erosion. The ECB has washed down into sediment trap 1B.
3) The slope protection on the southeast and west corners of the main pad, and on the SW corner of the tank pad, eroded sending rock and sediment into the designated channels and finally into the sediment trap.
4) The ECB has slumped down into the bottom of Channel CC10A on the cutslope side of the main pad.
    a. Channel CC10A on the east side of the pad experienced gully erosion. The ECB and TRM failed and migrated into sediment trap 2, along with eroded sediment from the channel.
5) The emergency spillway of sediment trap 2 has eroded into the grassy swale below the sediment traps. Some sediment was visible past the compost filter sock.

These issues constitutes a violation of 25 Pa Code §102.4(b)1 for failure to implement and maintain E&S BMPs to minimize the potential for accelerated erosion and sedimentation.

The onsite inspection log noted the last E&S inspection as being conducted 8/4/2016. The date however, is illegible and could also be interpreted as 8/9/2016. The comments section accompanying the recorded inspection notes for 8/4/2016 states, ”E&S working proper”. As a condition of the Erosion and Sedimentation Control permit, (8. MONITORING, INSPECTION, AND REPORTING REQUIREMENTS (a)), the permittee and co-permittee(s) must ensure that visual site inspections are conducted weekly, and after each stormwater event throughout the duration of construction and until the receipt and acknowledgement of the NOT by the Department or Conservation District. Inspections should occur within 24 hours of each stormwater event. The visual site inspections and reports shall be completed by qualified personnel, trained and experienced in erosion and sediment control, to ascertain that E&S BMPs are properly constructed and maintained to effectively minimize pollution to the waters of this Commonwealth. If the earth disturbance activities authorized by this permit at any time are found to create conditions that cause or threaten to cause pollution to waters of the Commonwealth, the permittee(s) shall immediately implement remedial measures to correct the conditions. Failure to do so constitutes a violation 102.5(m)4 which states, a person who conducts an activity under a general permit issued under this subsection shall comply with the terms and conditions of the general permit, with this chapter and other applicable laws."

Please address any deficiencies noted in this inspection report and contact me with any questions. I departed the site @1500 hours.

Pipeline preconstruction meeting, when severely eroded channels and multiple failed BMPs were observed and documented. Please see attached pictures for photo documentation of the following E&S issues:

1) An eroded trench, from accelerated stormwater runoff, was observed in the bottom of roadside channel CC2 from ~stations 8+00 to 5+00.
    a. Erosion has occurred on the embankment above the roadside channel CC2 from ~stations 7+00 to 5+00. The Erosion Control Blankets (ECB) failed causing sediment to erode and deposit into the channel bottom.
2) Channel CC9 appears to have experienced gully erosion. The ECB has washed down into sediment trap 1B.
3) The slope protection on the southeast and west corners of the main pad, and on the SW corner of the tank pad, eroded sending rock and sediment into the designated channels and finally into the sediment trap.
4) The ECB has slumped down into the bottom of Channel CC10A on the cutslope side of the main pad.
    a. Channel CC10A on the east side of the pad experienced gully erosion. The ECB and TRM failed and migrated into sediment trap 2, along with eroded sediment from the channel.
5) The emergency spillway of sediment trap 2 has eroded into the grassy swale below the sediment traps. Some sediment was visible past the compost filter sock.

These issues constitutes a violation of 25 Pa Code §102.4(b)1 for failure to implement and maintain E&S BMPs to minimize the potential for accelerated erosion and sedimentation.

Failure during pressure test of pipeline segment along access road resulted in sediment leaving LOD into roadside ditch. Actions taken immediately to stop the flow of water and sediment.
there was 100% LEL and 100% methane. The (9x5) vent pipe was open and set up with a Taylor plug and piped into the production line, there was 620psi on the production casing and 369psi on the production line. I took a walk around the location, everything looked OK.
I left the site at 11:45.
VIOLS for 25Pa Code § 78.86 Defective Casing Cement at the (13¿x9¿) annuli.

A review of the Department collected sample results as illustrated in the attached Table 1, reveal that a spill has occurred at the well site, and it is recommended that SWN should conduct characterization and remediation of the site.
A review of the Department collected sample results as illustrated in the attached Table 1, reveal that a spill has occurred at the well site, and it is recommended that SWN should conduct characterization and remediation of the site.
A review of the Department collected sample results as illustrated in the attached Table 1, reveal that a spill has occurred at the well site, and it is recommended that SWN should conduct characterization and remediation of the site.
At time of inspection, arrived on site at 11:45 a.m., the cellar had water at the bottom, a collar was on the (20x13) annulus with a vent pipe that was open and venting into the atmosphere and gas was detected at 100% LEL and 100% methane with an Altair 5X multi gas detector which was calibrated 12/15/15, the (9x5) vent pipe was open and set up with a Taylor plug, there was 371psi on the production casing and 369psi on the production line. I took a walk around the location and everything looked OK.
I left the site at 12:05 p.m.

At time of inspection, arrived on site at 9:15 a.m., a crew was on site plugging the 6H, the cellar was full of water, the (13x9) vent pipe was open and venting into the atmosphere with gas detected at 100% LEL and 15% methane, the (9x5) vent pipe was open and set up with a Taylor plug, there was 310psi on the production casing and the valves were closed on the production line while the 6H was being plugged. I took a walk around the location and everything looked OK.
I left the site at 10:45 a.m.

The Department has reviewed the site characterization and final report that was prepared by Resource Environmental and submitted by Southwestern Energy for the small spill that occurred on January 13, 2016 at their NR 24 Buckhorn Pad located

4/18/2016.

The wells associated with this site are as follows:
115-22008
115-21882
115-21888
115-22009

The site had some slippage along the access road leading in near the following GPS coordinate: 41deg. 58' 15" 75deg 37' 23". (Photos 1 and 2)

The site also had poor vegetative growth in the vicinity of coordinates: 41deg. 58' 13.8" 75deg. 37' 20.1". The poor vegetative growth could possibly be due to too much organic matter being incorporated into the soil from tree clearing operations, resulting in a tie up of the nitrogen necessary for proper germination. (Photos 3 and 4)

The sediment trap near coordinates 41deg. 58' 12.9" 75deg. 37' 21.8" is laden with sediment, most likely due to the poor vegetative growth directly uphill from the trap. (Photo 5)

If there are any questions please feel free to call me at (570) 346-5539.

Inspection of the Range 84 Markovitch Well Pad in response to a spill report by the operator. The incident occurred on Friday, June 10, 2016 at approximately 8:30 p.m. Initially, the spill was reported to Southwestern Energy (SWN) by the carrier as less than 5-gallons and clean-up began. A visual inspection by SWN personnel on the morning of Saturday, June 11th revealed the spill may have been more than initially thought and the spill was reported to DEP NERO's Emergency Response at 9:00 a.m. The information reached the Scranton O&G office at 9:00 a.m. on June 13, 2016. I spoke to SWN's Afton Sterling via telephone while on-site to obtain the details of the spill. I also received follow-up emails from SWN's Mike Deming that relayed some other details of the incident. A summary of both sources indicates that a waste water truck was in the process of loading production water from the production tank on the pad when the production fluid foamed in the truck and spilled over. The process was halted and clean up began with absorbent material and shovels. Due to the darkness and the foamy nature of the release, the quantity was initially difficult to estimate. On the morning of the 11th, the spill was reported DEP as approximately 10-gallons. The spill occurred directly in front of the production tank containment area where the truck connection is and affected the soil/gravel of the pad surface. The spill was not on containment. An area approximately 14-feet x 10-feet and 5-inches deep was excavated, yielding approximately 2-3 cubic yards of soil/gravel. The excavation base and perimeter was screened in 26 locations using a conductivity meter with results of less than 100 micro Siemens. Due to the volume of soil, and size of the excavation, the actual amount of fluid spilled was likely less than what was reported to DEP. The excavated soil was loaded onto a small dump truck for transport to the Meshoppen Rail Yard for ultimate disposal at the Tunnel Hill Reclamation Facility in New Lexington, Ohio. Work was completed and there was no one other than myself on-site at the time of the inspection. I observed an area approximately the size described that had been excavated and fresh gravel/soil had been replaced. There were no other indications of contamination on the ground.

On 6/20/16, the Department met with representatives from SWN to inspect the damage to the retention berm of infiltration area #1 that resulted from the landowner breaching the berm. SWN contacted the Department on 6/15/16 to report the disco

Afton Sterling of Southwestern Energy contacted me via telephone and email to inform me that a mulch berm had been installed within a delineated wetland area. The affected area of the wetland is estimated to be 2 feet wide and 19 feet long. The mulch material was removed immediately upon discovery and the boundary of the wetland was confirmed and re-staked to prevent additional encroachment.

The placement of fill within Waters of the Commonwealth is in violation of 35 P.S. § 691.401 (relating to the discharge of a substance of any kind or character to Waters of the Commonwealth). Further, the placement of the fill constitues a violation of 25 Pa. C.S. § 105.11, which relates to unpermitted waterway obstructions and encroachments.

Since the mulch material was immediately removed and measures implemented to prevent further encroachments, these violations are considered immediately corrected.

Afton Sterling of Southwestern Energy contacted me via telephone and email to inform me that a mulch berm had been installed within a delineated wetland area. The affected area of the wetland is estimated to be 2 feet wide and 19 feet long. The mulch material was removed immediately upon discovery and the boundary of the wetland was confirmed and re-staked to prevent additional encroachment.

Further, the placement of the fill constitues a violation of 25 Pa. C.S. § 105.11, which relates to unpermitted waterway obstructions and encroachments.

Since the mulch material was immediately removed and measures implemented to prevent further encroachments, these violations are considered immediately corrected.

Afton Sterling, Regulatory Supervisor of SWN, contacted Scott Kuchta, DEP O&G WQS at 9:40 AM on 8/5/16 to report a diesel fuel spill of an estimated (750) gallons to secondary containment that occurred on 8/5/16 at 5:30 AM. Southwestern Energy submitted a drilling resumption notice to the Department on 7/31/16 indicating that Southwestern Drilling Company Rig #45 will be re-entering the Cramer 2H at 18:00 hours on 8/1/16. Mr. Kuchta and I arrived at the site at 12:00 to conduct an investigation of the incident. SDC #45 is currently in the process of drilling the Cramer 2H well. This was a re-entry of the well. The well had been drilled to kick off point. The horizontal section of the well will be drilled to total depth with a mixture of diesel fuel and synthetic oil based mud. Initially, we met with Mike Deming, Senior Regulatory Analyst of SWN at the entrance gate to the site. We briefly discussed the incident prior to visually assessing it. Mr. Deming stated the following. “The spill volume has been revised from (750) to (375) gallons. The spill was reported to PADEP Northeast Regional Office in Wilkes-Barre, PA at 6:45 AM. An O-ring failed on a generator causing diesel fuel to leak onto the New Park rig mats. The diesel flowed through the seams in the mats, to the containment liner and felt beneath the mats, eventually to the ground due to a breached seam or hole in the liner. Upon completion of our discussion, we walked over to the area on the well pad where the spill occurred in order to assess the incident. Additional SWN personnel accompanying the Department during the inspection included Ms. Sterling, John Hughes, Drilling Superintendent of SWN, Dan Hesserdorfer, site company man of SWN, Justin Phillips, Health, Safety, and Environmental Supervisor of SWN, and Diego Nuila, Regulatory Analyst, of SWN. Based on our observations, it turns out that the spill was not completely contained as originally reported. We observed pools of red dyed diesel fuel with an odor present, on the pad surface in between a frac tank containing fresh water used for cementing of the wells and a frac tank which is used for rig and coolant water according to SWN. Apparently, the liner had been removed to assess the ground surface beneath it. There is also staining observed on the liner and felt. There are pools of diesel fuel on containment and in openings in the rig mats near the generators. There are also white colored absorbent pads on containment used in attempt to contain the spill. There is a petroleum sheen observed on the pad surface next to the containment berm near the generators. It appears that the diesel fuel is emanating from under the containment. The result of the release according to Mr. Hughes was an O-ring failing on a ray core filter system on a generator, which filters diesel fuel coming into the engine of the generator. Mr. Hughes stated that the generators are used to power the rig and rig equipment and this is not the diesel fuel mixed with synthetic oil based mud that is used for drilling purposes. Apparently, the diesel fuel flowed out of the generator onto the rig mats and in between the wedges/seams of the mats. The containment below the mats either has compromised integrity or gaps in between the seams.

Afton Sterling, Regulatory Supervisor of SWN, contacted Scott Kuchta, DEP O&G WQS at 9:40 AM on 8/5/16 to report a diesel fuel spill of an estimated (750) gallons to secondary containment that occurred on 8/5/16 at 5:30 AM. Southwestern Energy submitted a drilling resumption notice to the Department on 7/31/16 indicating that Southwestern Drilling Company Rig #45 will be re-entering the Cramer 2H at 18:00 hours on 8/1/16. There are pools of diesel fuel on containment and in openings in the rig mats near the generators. There are also white colored absorbent pads on containment used in attempt to contain the spill. There is a petroleum sheen observed on the pad surface next to the containment berm near the generators. It appears that the diesel fuel is emanating from under the containment. The result of the release according to Mr. Hughes was an O-ring failing on a ray core filter system on a generator, which filters diesel fuel coming into the engine of the generator. Mr. Hughes stated that the generators are used to power the rig and rig equipment and this is not the diesel fuel mixed with synthetic oil based mud that is used for drilling purposes. Apparently, the diesel fuel flowed out of the generator onto the rig mats and in between the wedges/seams of the mats. The containment below the mats either has compromised integrity or gaps in between the seams.

Afton Sterling, Regulatory Supervisor of SWN, contacted Scott Kuchta, DEP O&G WQS at 9:40 AM on 8/5/16 to report a diesel fuel spill of an estimated (750) gallons to secondary containment that occurred on 8/5/16 at 5:30 AM. Southwestern Energy submitted a drilling resumption notice to the Department on 7/31/16 indicating that Southwestern Drilling Company Rig #45 will be re-entering the Cramer 2H at 18:00 hours on 8/1/16. Mr. Kuchta and I arrived at the site at 12:00 to conduct an investigation of the incident. SDC #45 is currently in the process of drilling the Cramer 2H well. This was a re-entry of the well. The well had been drilled to kick off point. The horizontal section of the well will be drilled to total depth with a mixture of diesel fuel and synthetic oil based mud. Initially, we met with Mike Deming, Senior Regulatory Analyst of SWN at the entrance gate to the site. We briefly discussed the incident prior to visually assessing it. Mr. Deming stated the following. "The spill volume has been revised from (750) to (375) gallons. The spill was reported to PADEP Northeast Regional Office in Wilkes-Barre, PA at 6:45 AM. An O-ring failed on a generator causing diesel fuel to leak onto the New Park rig mats. The diesel flowed through the seams in the mats, to the containment liner and felt beneath the mats, eventually to the ground due to a breached seam or hole in the liner. Upon completion of our discussion, we walked over to the area on the well pad where the spill occurred in order to assess the incident. Additional SWN personnel accompanying the Department during the inspection included Ms. Sterling, John Hughes, Drilling Superintendent of SWN, Dan Hesserdorfer, site company man of SWN, Justin Phillips, Health, Safety, and Environmental Supervisor of SWN, and Diego Nuila, Regulatory Analyst, of SWN. Based on our observations, it turns out that the spill was not completely contained as originally reported. We observed pools of red dyed diesel fuel with an odor present, on the pad surface in between a frac tank containing fresh water used for cementing of the wells and a frac tank which is used for rig and coolant water according to SWN. Apparently, the liner had been removed to assess the ground surface beneath it. There is also staining observed on the liner and felt. There are pools of diesel fuel on containment and in openings in the rig mats near the generators. There are also white colored absorbent pads on containment used in attempt to contain the spill. There is a petroleum sheen observed on the pad surface next to the containment berm near the generators. It appears that the diesel fuel is emanating from under the containment. The result of the release according to Mr. Hughes was an O-ring failing on a ray core filter system on a generator, which filters diesel fuel coming into the engine of the generator. Mr. Hughes stated that the generators are used to power the rig and rig equipment and this is not the diesel fuel mixed with synthetic oil based mud that is used for drilling purposes. Apparently, the diesel fuel flowed out of the generator onto the rig mats and in between the wedges/seams of the mats. The containment below the mats either has compromised integrity or gaps in between the seams.

Apparently, the diesel fuel flowed out of the generator onto the rig mats and in between the wedges/seams of the mats. The containment below the mats either has compromised integrity or gaps in between the seams.

At time of inspection, arrived on site at 12:50p.m. regarding a spill that was reported to the Department on 10/4/16, I met with company man Jonathan Davidson, Halliburton was on site to frack the 1H well. A truck hauling sand to the frack job started leaking anti-freeze on the entrance road. It pulled onto the well site to a flat location at the entrance of the site where a pan was put under the truck. Jonathan informed me that it lost about 7 to 10 gallons of anti-freeze; most of it was where the truck stopped on the site. The anti-freeze was cleaned up by SGSF with a skid steer and put in a role off container. I took a walk along the entrance road and there was no anti-freeze noticed on the road or below where Jonathan said the leak started.
I left the site at 13:35p.m.

Routine inspection conducted to assess conditions during well completion activities.

A petroleum sheen was observed off of containment along the western side of the well site. The sheen extended from near the job operations trailer toward the southwest corner of the well pad. Most of the sheen area was silvery, with a brightly colored sheen closest to the job trailer. Two site personnel were spot cleaning with petroleum absorbent pads within the spill area upon my arrival. I informed Jonathan Sites of Southwestern, the on-site representative, of these findings, and recommended that additional clean up measures be implemented. I also contacted Afton Sterling, Southwestern Regulatory Manager, and informed her of my findings. She indicated that a crew would be dispatched to vacuum the puddles in the spill area and scrape the pad surface to remove affected material.

During my call with Ms. Sterling, she mentioned an estimated 3-5 gallon ethelyne glycol spill that had occurred off containment the previous night. She indicated that the spill was reported to the Department (Complaint ID No. 323533) and was cleaned up. No evidence of this spill was observed during my inspection.

Since ethelyne glycol and a petroleum substance were spilled on the pad surface, the releases had the potential to pollute waters of the Commonwealth, which is in violation of 35 P.S. § 691.402(b). Title 35 P.S. § 691.402(b) prohibits conducting activities regulated by permits issued pursuant to Section 402 of The Clean Streams Law to prevent the potential of pollution contrary to the issued permits or without a permit. Further, since the spills occurred off of containment, the releases are in violation of 25 Pa. Code § 91.34(a), which requires permittees to take measures to contain pollutants.

On December 1, 2016, the Department and SWN Production Company, LLC (Southwestern) collected groundwater samples from the excavation at the SWNPC Moore Pad. Upon review of the Department's and SWNPC's groundwater sample results, it was noted that the sample results had elevated concentrations of barium, strontium, aluminum, chloride, iron and manganese. Barium was detected above the Act 2, Residential and Non-residential Medium Specific Concentration (MSC) for groundwater of 2,000 micrograms per liter (µg/l) with a concentration of 33,570 µg/l detected in the Department's sample and 34,500 µg/l detected in SWNPC's sample. Strontium was detected above the Act 2, Residential and Non-residential MSC for groundwater of 4,000 µg/l with a concentration of 52,200 µg/l detected in the Department's sample and 48,800 µg/l detected in SWNPC's sample. Aluminum was detected above the Act 2 Secondary Maximum Contaminant Level (SMCL) of 200 µg/l with a concentration of 9,581 µg/l detected in the Department's sample and 12,500 µg/l detected in SWNPC's sample. Chloride was detected above the Act 2 SMCL of 250,000 µg/l with a concentration of 1,511,000 µg/l detected in the Department's sample and 1,470,000 µg/l detected in SWNPC's sample. Iron was detected above the Act 2 SMCL of 300 µg/l with a concentration of 23,970 µg/l detected in the Department's sample and 22,600 µg/l detected in SWNPC's sample. Manganese was detected above the Act 2 SMCL of 50 µg/l with a concentration of 1,657 µg/l detected in the Department's sample and 1,560 µg/l detected in SWNPC's sample. Bromide was detected at a concentration of 13,343 µg/l in the Department's sample and 7,910 µg/l detected in SWNPC's sample. Calcium was detected at a concentration of 293,000 µg/l in the Department's sample and 280,000 µg/l detected in SWNPC's sample. Sodium was detected at a concentration of 625,000 µg/l in the Department's sample and 518,000 µg/l detected in SWNPC's sample. Upon review of the SWNPC's soil sample results, it was noted that the sample results had an elevated concentration of Arsenic. Arsenic was detected above the Act 2, Soil to Groundwater, Used Aquifers, MSC for soil of 150 milligram per kilogram (mg/kg) with a concentration of 169 mg/kg. Arsenic was detected above the Act 2, Direct Contact, Residential, MSC for soil of 12 milligram per kilogram (mg/kg) with a concentration of 169 mg/kg. SWNPC's background soil sample collected at the Moore Pad exhibited a concentration of Arsenic of 7.48 mg/kg.

On December 1, 2016, the Department and SWN Production Company, LLC (Southwestern) collected groundwater samples from the excavation at the SWNPC Moore Pad. Upon review of the Department's and SWNPC's groundwater sample results, it was noted that the sample results had elevated concentrations of barium, strontium, aluminum, chloride, iron and manganese. Barium was detected above the Act 2, Residential and Non-residential Medium Specific Concentration (MSC) for groundwater of 2,000 micrograms per liter (µg/l) with a concentration of 33,570 µg/l detected in the Department's sample and 34,500 µg/l detected in SWNPC's sample. Resolved by consent decree Enf Id 223260

Failure to restore or develop drilled well. Leaks gas rapidly around annulus, pits all open, no well development , no return of grade or restoration.
According to record, permit granted on 1/3/03 with operator completed the well on 12/3/03 to depth of 3775 ft. WRAC was submitted to PADEP and approved on 1/12/04. Well head consisted of 8¿ pipe to 4¿ to 2¿ production pipe with shut off valve

op. failed to install a vent/ monument marker for this plugged well.

Compliance evaluation inspection conducted with A. Eichler. Previous violations noted 7-10-01. Accelerated erosion on site corrected. Vegetative cover appears > 70%. Access road has had one water bar installed. Additional culverts/water bars required to comply w/102.

Well not identified in any manner.

* spoke with operator consultant M.Hoover who indicated corrective action to begin ASAP.

Operator reported vandals took 30 barrels of oil and discharged approximatly 15 barrels to surface late Sunday morning 10/08/2006. Crude oil flowed down roadway ditches along Cemetery Road , SR 1007 and entered eddy that empties into Oilcreek. Oil absorbent pads were placed in ditches and oil booms were placed at mouth of eddy where waters empty into Oilcreek. Oil cleanup by operator did take place Sunday afternoon along roadway ditches after operator was notified of the incident 1:00 PM by passing motorist. Operator will notify Pa. State Police of incident.

Well remains operating and properly identified. No E&S concerns at present. Violation still exists...well drilled at wrong location.
A culvert placed at the intersection with the main access road and the access road to this well has been blocke on the up slope side of the culvert causing water to channel into and down the road.
Investigated due to complaint #166918.
A culbert placed on access road is improperly installed. On the upslope side the culvert is to high to carry stromwater away from the road.
At the entrance to the access road the culbert is blocked causing water to channel down the the road. BMP's are not being maintained and accelerated erosion is occurring.
This permit was canceled. Well was never drilled. Site was constructed. Site has since been reclaimed but the distrubed area was not stablized with mulch. The main access road in front of this site has a low area were water is collecting on the rc
The well is tagged and producing.
The culvert on the access road has been filled in with soil and rock causing water to channel down the access road.
Accelerated erosion is occurring.

access road.
Brine tank located on site and appears full. During inspection Department observed a leak from the inflow flange connected at the top of the brine tank. An approximate area measuring 4’x6’ directly below the leak appears to be impacted, as indicated by discolored soil and distressed vegetation. Called Operator at 12:11 and informed answering service of findings and requested responsible person to contact Department immediately in regards to this matter.
SEE ADDT'L COMMENTS ON PAPER SAIRs

At time of inspection, well tag present and legible. Inspected with Environmental Trainee S. Alawattegama.
Department observed area of lack of vegetation beside brine tank that extends approximately 20 feet down gradient into nearby corn field.
Violation(s) may be issued based on Operator response.
UPDATE: 9-14-15. Department spoke to Operator Rep. Drew Adamo by phone on 9-3-15 and requested brine tank readings in order to determine the quantity of brine released. Mr. Adamo stated that release was a historic release and that impacted soils would be cleaned up within 10 days.
Violations being issued:
Operator discharged brine or other fluids on or into the ground or into waters of the Commonwealth, and
Failure to notify DEP of pollution incident. No phone call made forthwith.

characterized by wet, muddy soils and a lack of vegetative growth which may be evidence of a prior release and/or discharge. One potentially-impacted area appears to originate near tank valve and is approximately 3-4' x 5-6' in size. There is another potentially-impacted area behind the brine tank that appears to be approximately 7'x4' in size. Soil samples were collected up-gradient from the brine tank, within the potentially-impacted area near the tank valve, and within the potentially-impacted area behind the brine tank.This inspection is currently pending upon the Operator's response and/or receipt and review of the sample results.

Howard P. Knauf #2 and Permit# 37-063-20872.

I do not have the lab results yet, but I will forward them as soon as I get them.

What happened: The nipple connecting the valve to the tank broke while the water truck driver was trying to hook up his hose to empty the tank. The substance spilled was produced water. Toys excavated the site and samples were taken to Environmental Services Lab for analysis. A roll off box from MEI is on site and it will be disposed of when a waste profile is generated. The site will be back filled with top soil and seeded and mulched when lab results are back.

On September 17, 2013 an inspection was conducted at the State Tract 856 822 Pad in Gaines Township, Tioga County. The last inspection conducted on behalf of the operator was on 9/12/13, the only issue noted was that previously noted issues have not been addressed. During this inspection the following was noted: the cut slope below the pad are recently seeded and mulched. This site is in need of additional E&S controls until 70% vegetative stabilization is established. A copy of the E&S plan was not maintained on site.
Ultra Resources was contacted and made aware of the issues at the site, conducted a site visit and prepared to correct the issues. A follow-up inspection was conducted on September 23, 2013;Silt sock has been installed below the cut slope. A

THIS WELL WAS ALTERED BY PAUL AIELLO,MIKE SCHREINER,AND BOB KIGHTLINGER WITHOUT OBTAINING A PERMIT IN JUNE 00. WELL IS REFERRED TO AS PET CEMETERY 1 IN BRADFORD TWP.
Access road encroaches on wetland. Rig onsite pluging well.
Pad for plugging has been built over wetland.
Pad for plugging has been built over wetland.
Well registered and plugged as 049-00317 8/8/2006

On 5/1/15, I performed an inspection of the Cumberland W1203 (McCay#4) well plugging site. The site is located in Wayne Twp., Greene County. The inspection was performed as a rountine inspection after a well plugging and restoration.

The operator has placed silt sock in the wetland downgradient from the well plugging site. A notable sheen was seen on the waters of the wetland as well as bentonite based drill mud was noted in the wetland. The vegetation in the wetland adjacent to the plugging site and noted drill mud shows impacts. P.C. with the Phil Peterson (Alpha Natural Resources) during the site inspection revealed that during the well plugging operations drill mud had entered the wetland around the conductor setup to plug the well. Daybrook Drilling had noted the loss of drill mud and return of the mud to the surface in the wetland. This was reported to Alpha at time of incident.

wells were not drilled in the correct location, 3211 (f) (1)

This inspection is in response to a telephone call received from the operator that their personel
had found a crude oil spill adjacent to their tank battery located near this well. The tank battery consisted of 3-210 bbl stock tanks, # FB-754 431502,431503,and431504,a buried brine tank and separator. There was oil on the sides of all three stock tanks indicating that the tanks had overflowed some time in the past. It appeared that oil had moved through the gravel in the containment and moved out of the containment through the soil. The oil then moved approximately 200-300 feet through and very rocky area and made its way into an UNT to Wolf Run. A crew was on site removing the oil on the surface of the ground. I instructed the opertor to install siphon dams in the stream to contain any further flow of oil. The spill appeared to consist of only crude oil with no other constitutients. It is estimated that the quantity spilled was 1-3 barrels. Photos were taken I also Instructed the operator to contact ECP to initiate the Act 2 process

Drilling appeared to have been completed at the time of the inspection. Brine tank located onsite and appeared to be in sound condition. Observed accelerated erosion & sedimentation leaving the well-site due to improper erosion control implemen
Drilling had commenced on 01/15/08, as noted in an inspection report from 11/24/08. In that report it was noted that the site had been recently seeded & mulched, and that the vegetation did not meet the 70% uniform coverage criteria.
At the time of the inspection the well appeared to be equipped for & in production at the time of the inspection. Brine tank was located onsite and appeared to be in sound condition. Observed no accelerated erosion & sedimentation in relation to the well-site or access road. Found that the vegetative cover of the site did not meet the 70% uniform coverage criteria.

Well site appears to be in production.

The following deficiencies were noted during the inspection:
1- The vegatative cover does not reach the 70% threshold.
2- As a result of erosion, there are deep ruts in the access road.

Operator representative Harry Mills was notified of the findings.

Well site appears to be in production.

The following deficiencies were noted during the inspection:
1- The vegatative cover does not reach the 70% threshold.
2- As a result of erosion, there are deep ruts in the access road.

Operator representative Harry Mills was notified of the findings.

Operator failed to restore site within 30 days of permit expiration.
Operator failed to restore site within 30 days of permit expiration.

The permit 005-30785 expired on 02/11/13. Well-site and access road had been constructed except for a stream crossing of an Unamed Tributary (UNT) to Brady Run. This stream crossing would have required a General Permit. The access road as constructed had minimal to no implemented erosion controls, especially on the steepest portion of the road as it approached the UNT from the main access road for the project area. In addition the access road had no erosion controls implemented for the portion of the road across the UNT approaching the well pad. The well pad itself had not been temporarily stabilized which resulted in sediment generated and transported onsite eventually overtopping the silt fencing implemented.
The permit 005-31035 expired on 03/16/13. Site had not been restored within 30 days of the expiration of the drill permit. No accelerated erosion or sedimentation was observed in relation to the site or access road.
The permit 005-30986 expired on 01/18/13. Site had not been restored within 30 days of the expiration of the drill permit. No accelerated erosion or sedimentation was observed in relation to the site or access road.
Orginal permit 005-30785 expired on 2/11/13. Repermitted (005-31136). Well site n AR constructed except for stream crossing of UNT to Brady Run, which would reguire a GP. Previously constructed waterbars have eroded and discharging sediment offsite. Well pad has not been temporarily stabilized, resulting in accerlated erosion and sedimentation offsite after overtopping temporary bmps (ie filter fence).

Violations previously issued under 005-30785 are exisitng and will be handled under newly issued permit number for Crotallo 2 Well.
11/2/15 proposed COA sent to US Energy Expl (never executed); 8/5/15 Order sent to US Energy Expl (Enf ID 341596); was apealled to Env. Hearing Board; 1/21/16 COA executed (Enf ID 341601); 2/19/16 Notice of Breach of COA sent to US Ene

ell appeared to be equipped for production. There was no observed accelerated erosion or sedimentation in relation to the site or access road. Met onsite with Us Energy Personnel to review a small leak observed in the brine tank by OGI Braunns. There was a leak below the well tag on the tank where it appeared that the tank had rusted through and was allowing a slow weeping of fluids to be releases, flow along the tank and deposit immediately beside the tank. The affected area appeared to be localized and it did not appear that the release was more than 5 gallons but less than 42 gallons.

US Energy's intended course of action is to as soon as possible have the tank tank emptied and moved offiste. Once that action is completed the affected media wil be excavated, removed and properly disposed of in accordance with the O&G spill policy, specifically the section dedicated to small spills less than 42 gallons. US Energy personnel anticipate all corrective actions to be completed by 07/08/16, provided weather conditions are favorable.

Uncontrolled release and fire. Inspection found, pollutants off-site, inadequate BMPs and major modifications withour Department approval.
On 8/22/2014, I performed an inspection of Vantage Energy's Habe Street well pad site. The site is located in Washington Twp., Greene County. The inspection was performed as a routine site inspection post rainfall event.

The operator informed the DEP that a sediment trap failed after a rainfall event on 8/20/14. The sediment trap failure caused the recently constructed well pad slope to errode and the perimeter BMPs to fail. Mud caused triple stacked silt sock to break and sediment traveled approx. 400' downgradient outside the LOD onto the neighboring property.

On 8/22/2014, I performed an inspection of Vantage Energy's Habe Street well pad site. The site is located in Washington Twp., Greene County. The inspection was performed as a routine site inspection post rainfall event.

The operator informed the DEP that a sediment trap failed after a rainfall event on 8/20/14. The sediment trap failure caused the recently constructed well pad slope to errode and the perimeter BMPs to fail. Mud caused triple stacked silt sock to break and sediment traveled approx. 400' downgradient outside the LOD onto the neighboring property.

On 11/5/2014, I performed an inspection of Vantage Energy's Shumaker well pad site. The site is located in Center Twp., Greene County. The inspection was performed as a routine inspection related to an unreported spill during fracking activity.

The operator informed the DEP that a spill had occurred at the location, but was not reported to the DEP because the spill was believed to be freshwater.

The spill occurred on 10/16/14 during fracking operations on the 12H when a tranducer at the well head failed causing a spill of 400 barrels of frac fluid to containment and approx. 50 gallons left containment.

On 11/5/2014, I performed an inspection of Vantage Energy's Shumaker well pad site. The site is located in Center Twp., Greene County. The inspection was performed as a routine inspection related to an unreported spill during fracking activity.

The operator informed the DEP that a spill had occurred at the location, but was not reported to the DEP because the spill was believed to be freshwater.

The spill occurred on 10/27/14 during fracking operations on the 2H when a tranducer at the well head failed again causing a pill of 20 barrels of frac fluid and approx. 20 gallons left containment.

On 9/17/2015, I performed an inspection of Vantage Energy Patton well pad site. Present at time of inspection was Doug Wilson, Jerry DeRosa, Lou Schall (Vantage Energy), Josh George (Rockwater), and Noel Messing (SE Tech). The site is located in Franklin Twp., Greene County. The inspection was performed as a response to a reported spill by the operator.

The operator reported a spill of 52 barrels of flow back water to secondary containment, with 12 barrels leaving containment and discharging to the well pad and well pad slopes on 9/16/15. The discharge of flow back water occurred during flow back operations on the Patton 6H well. The operator had Weavertown Environmetal Group on site to begin cleanup activities and removal of impacted material for disposal.

On 9/17/2015, I performed an inspection of Vantage Energy Patton well pad site. Present at time of inspection was Doug Wilson, Jerry DeRosa, Lou Schall (Vantage Energy), Josh George (Rockwater), and Noel Messing (SE Tech). The site is located in Franklin Twp., Greene County. The inspection was performed as a response to a reported spill by the operator.

The operator reported a spill of 52 barrels of flow back water to secondary containment, with 12 barrels leaving containment and discharging to the well pad and well pad slopes on 9/16/15. The discharge of flow back water occurred during flow back operations on the Patton 6H well. The operator had Weavertown Environmetal Group on site to begin cleanup activities and removal of impacted material for disposal.

On 10/5/2015, I performed an inspection of Vantage Energy Rogersville/Shumaker well pad site. Present at time of inspection was Greg Seibert, John Bender, Jerry DeRosa, (Vantage), and Tim Ratvasky (SE Tech). The site is located in Center Twp., Greene County. The inspection was performed as a response to a reported spill by the operator.

The operator reported a spill of 23 barrels of drilling mud to secondary containment, with 8 barrels leaving containment and discharging to the well pad and well pad slopes on 10/5/15. The discharge of drilling mud occurred during drilling operations on the Shumaker 10H well. A mist of drilling mud was on the southwest side of the well pad slope with a majority of the drilling mud discharging to the well pad on the northeast side of the well pad near the production units on site. The operator had Weavertown and McCutheon Environmetal Groups on site to begin cleanup activities and removal of impacted material for disposal.

On 1/5/2016, I performed an inspection of Vantage Energy James Rice well pad site. Present at time of inspection was John Bender, Jerry DeRosa, Greg Seibert (Vantage Energy), Noel Messing and Ken Sentgeorge (SE Tech). The site is located in Jackson Twp., Greene County. The inspection was performed as a response to a reported spill by the operator.

The operator reported a spill of 82 barrels of flow back water to secondary containment, with 10 barrels leaving containment and discharging to the AST pad and tank pad slopes on 1/5/16. The discharge of treated reuse water occurred during hydraulic fracturing operations on the James Rice 13H and 14H wells. The operator had Weavertown Environmetal Group on site to begin cleanup activities and removal of impacted material for disposal, with direction of SE Technologies.

On 1/5/2016, I performed an inspection of Vantage Energy James Rice well pad site. Present at time of inspection was John Bender, Jerry DeRosa, Greg Seibert (Vantage Energy), Noel Messing and Ken Sentgeorge (SE Tech). The site is located in Jackson Twp., Greene County. An estimated 200 gallons of brine was released from a broken site tube on a water truck leaving the Patton Well Site in Franklin Township, Greene County. The release impacted part of the access road between Throckmorton Run and the gate, as well as a few hundred feet of asphalt pavement on Hill School House Road and several areas of compacted gravel berm along the road. Notifications were made, personnel mobilized and the impacted areas remediated.

The failure to contain the brine release is a violation of Title 25 Pa. Code § 91.34(a). The impact to soils resulting from the release of brine is a violation of the Clean Streams Law 35 P.S. § 691.401.

On Monday May 16, 2016 the original NOV dated May 2, 2016 for the brine spill at the Patton Well Site was revised with more appropriate citations. Waters of the Commonwealth were not impacted therefore the Clean Streams Law 35 P.S. § 691.401 was not violated and 35 P.S. § 691.301 is being cited due to the impact to the ground surface. Title 25 Pa. Code § 78.54 is being substituted for Title 25 Pa. Code § 91.34(a) because it is the more appropriate citation.

Vantage exceeded its daily limit on several days and also daily data does not match data entered in WUDS
On 1/16/2014, I performed an inspection of Vantage Energy's Porter Street well pad site. The site is located in Franklin Twp., Greene County. The inspection was performed because of a possible site emergency related to earth movement on the well pad fill slope.

The operator informed the DEP that a slide approx. 250' in length had dropped approx. 40' at the drill pad. The slide material had left the LOD and was encroching on a stream channel. The slide had begun moving within the LOD on 1/15/14, and had moved outside of the LOD on 1/16/14, which is when the phone call came to the DEP.

The operator was monitoring the site and preparing engineering plans to make a modification to the ESCGP to address the slide. The operator is continuing drilling operations of the site, but has moved one job trailer, and generator directly above the slide on the drill pad. Upon recommendation from the DEP, the operator plans on moving a second job trailer, and moving a 6,000 gallon fuel tank near approx. 75' from the slide.

Tank valve cracked. Small but steady leak. Corrected on site by phone call to well tender.

The IR of drill mud impacted ST40428 an unnamed tributary to Grimes Run and Grimes Run. At two locations on the east and west sides of I79 the drill mud returned to surface and discharged outside of the pipeline LOD, entering two separate streams. Approx. 5,000' of stream channel was impacted by the drill mud. The operator was in process of installing silt sock downgradient of the discharges in an attempt to prevent further impacts of the drilling mud to the waters of the state. The Department spoke with the operator on site inregards to cleanup procedures moving forward.

Well is drilled, but not equipped for production. Site ID sign and E&S plan located.

Several violations were noted- According to land owner and WGM employees, the pit liner had to be replaced because the previous liner had a hole in it. The hole in the liner resulted in the release of drilling fluids into a neighboring stream. A gray mud was evident on the stream bed and banks. The DEP was not notified of this release.

Well was in production at the time of the inspection. The following deficiency was noted:

1- The culvert that is located on the access road has become completely clogged. The stream is now running over the access road. Please note that the stream is an unnamed tributary of Brush Creek, which is a TSF. When cleaning the culvert, use additional BMP's when possible.

In addition to the deficieny there was also an E&S concern noted:
Due to a recent storm event, ruts have started to develop in the access road. Eventually these ruts could worsen to the point of making the road inaccessible.
Drilling completed 4/21/2008.
Site ID sign in place. E&S plan on site. Well is not equipped for production (well head only on site).
Access road stable with no signs of accelerated erosion.
Inspection revealed the following deficiencies:
1) Failure to restore site within 9 months of completion of drilling. - Lined pit is still open on site, containing drill cuttings and fluids. Site has not been backfilled, or seeded and mulched. Some naturally occuring vegetation was on site, but it is far from the required 70% uniform, perennial vegetation that is required. 2) Failure to minimize accelerated erosion, implement E&S plan, and stabilize site. BMP's that were included in the E&S plan were not installed on the site, such as hay bales or silt fence on the down-slope side of the site. Washed out areas were found on the down-slope side of the site. No BMP's were in place to stabilize the site. 3) Failure to maintain 2' freeboard in an impoundment. 4) Failure to plug an abandoned well.

Fluid slag filled up inside a tank labeled petroleum pipeline fluid forcing a dump valve to blow off. Fluid emitted out of the top of the tank and out of a vent protuding through the roof of the containment area for the production fluid tank. The fluid impacted the surface of the ground in three (3) different areas of the site outside of the containment area for the tank. This constiutes a violation of Section 402 of the Clean Streams Law, 35 P.S. § 691.402 and Section 301 of the Solid Waste Management Act, 35 P.S. §6018.301.

Williams reported that on 11/7/2012, around 2:30 pm, they had pulled the bridge from the tributary and then at 4:00 they discovered that the slope had failed and shifted toward the stream. Mr. Lee explained that approximately 85' from the stream (SPA-EMT-009 located at Station 531+82) that there was a tension crack. Williams had open cut the stream on Friday 11/2/2012. At the time of the inspection, it was noted that multiple excavators were along the ROW pulling material, from the stream, upslope.Silt fence was installed along the bottom of the slope. While on site it was noted that logs had slid over the silt fence causing additional material to enter the stream. Turbid water was noted below this area. The Department requested that as soon as safety permits that Williams remove the logs and maintain the silt fence. Additionally, the Department requested that Williams monitor the work being performed and if deemed necessary, take action to install any

The Department was on site at the Horton Pipeline in response to a self-reported release of hydraulic fluid. On April 4, 2013 the Department received a call from Dale Ann Buchanan (Williams Field Services) who explained that there was a hose line leak on the Horton Pipeline in Lathrop Township Susquehanna County. The report indicated that two (2) gallons of hydraulic oil were released to the wetland mats. A John Deer 350 released the hydraulic fluid. They removed 3 wetland mats which they took back to their pipe yard for cleaning and replaced with different mats. They removed the soil beneath the mats which they termed as subsoil. They placed the material into two (2) garbage bags and sent it to the Linde pipe yard in Lemon, PA. This release occurred on the wetland mats, at Station 49+90, in Wetland M.

The Department requests that the operator submit confirmatory sample results to the Department within 3 business days of receipt.

Williams reported, additional fill in wetland. Permit was issued 10/16/2012. Williams responded by reseeding with wetland mix & providing documentation of reclamation activity.
he Department (Frank Hoehle and I) were on site in response to the self-reported slope failure at Station 12+39. We met with Joe Crea (Williams Field Services -EH&S Specialist) and Bill Steedley (JRJ- Sr. Environmental Inspector). During this ins

The Department was on site at the Church to Central Pipeline Project in response to a self-reported incident. The Department (Frank Hoehle and I) met with Brandon Cady (Williams Inspector) and Steve Himl (EI). During this meeting it was reported that the material had sloughed and slumped but was caught by the curlex at Station 101+50-57. At the time of the inspection, they were using a pump around system with a filter bag that had holes cut into it to function as a dissipater. Stream flow both upstream and downstream of the pipeline was clear. Williams removes the dam at the end of each work day and rebuilds it in the morning to utilize the pump around until the work is complete in that area. Crews were currently situating large rip rap along the northern side of the stream. They plan to do the same on the southern side as well where they will then cover it with soil and stabilize with vegetation. Williams reported that no material impacted the stream.

The right of way (ROW) did not appear to meet temporary stabilization requirements. The ROW was extremely sparsely vegetated at the time of the inspection. Sediment laden water was pooled on both sides of the ROW. A larger amount of wate
The Department conducted an inspection on 7/1/14 of the Williams Gibson Pipeline starting at the SR 92 crossing and heading west ending at location latitude N 41° 47' 34.09" and longitude W 75° 35' 31.91". During the inspection, violations were r
The Department conducted an inspection on 7/3/14 of the Williams Gibson Pipeline starting at the Cabot Reilly J. Pad and heading west ending at location latitude N 41° 47' 39.92" and longitude W 75° 35' 02.71". Also present during the inspection
and identified the following deficiencies and violations:
1. The rock construction entrance at the East side of SR2075 (Station 23+50) is not authorized, and I don't recall seeing the extent of compost filter sock installed as indicated along the edge of the SR. Nor is there a wash rack at this location,
despite it discharging immediately to an EV wetland.
2. There were also no wash racks at the authorized accesses off of State Route 2075, Station 25+00-26+00, as noted on Sheet 3 of 21.
3. Wetland Restoration, drawing sheet 2A of 21, of Wetland "WPA-SLH-048" has not been started, although the work within this area has been completed. Site specific Sequence of Construction for Wetland -048 Step 8b. and 8c. has not been completed (drawing sheet 17 of 21).

Since Williams Field Services has failed to present evidence to the Department which demonstrates that the additional work conducted on this site was authorized under the current permit, the Department finds Williams Field Services to be in violation of the following Laws and regulations:

The Clean Streams Law, 35 Pa. C.S. 691.611 Unlawful conduct in failing to comply with the approved permit

Title 25 Chapter 102.4(b)(5) E&S plan drawings and narrative not reflective of as-built conditions.

102.11 E&S and PCSM BMP's not approved for as-built conditions.

102.8 An approved PCSM plan has not been developed for the as-built conditions of this site.

102.11 E&S and PCSM BMP's not approved for as-built conditions.

102.8 An approved PCSM plan has not been developed for the as-built conditions of this site.

Inspection resulted from permitting section review of NOT for the use of the void space in the aggregate pad on the site as a PCSM BMP. Upon inspection, several areas of the aggregate pad were observed to be heavily compacted with little to no void space; ponded water was observed in several areas; and four catch basins on the site promoted positive drainage, reducing volume and rate control for the aggregate void space as a PCSM BMP. In areas where loose stone aggregate was observed, depth ranged from appx. 1.5 to 3.5 inches, with heavily compacted aggregate below that. The site, as constructed, operated and maintained has limited the ability of the aggregate pad to adequately function as a PCSM BMP. The Department recommends a modification to the PCSM Plan.

H&P Rig 287 was running at time of inspection. Fred Webb was the company man. Mr. Webb and DEP walked the site. Two french drains were found leading from the pad into a drainage ditch. Both drains had a small amount of suds in their drainage. Mr. Webb closed the valve on the main drainage route leading from the protective diking effectively stopping the discharge of stormwater from the site.
Inspection of rig found chemical totes next to the compressors. These totes were placed on the edge of the secondary containment with their valves hanging over the non-containment part of the pad. Suds were visible beneath the valve of the tote containing soap. This is the most probable source of the contamination.
Other areas of secondary containment were comprimised where trucks had driven over edges.
Sample 0629735 was taken in the drainage ditch on the South corner of pad.

H&P Rig 287 was running at time of inspection. Fred Webb was the company man. Mr. Webb and DEP walked the site. Two french drains were found leading from the pad into a drainage ditch. Both drains had a small amount of suds in their drainage. Mr. Webb closed the valve on the main drainage route leading from the protective diking effectively stopping the discharge of stormwater from the site.
Inspection of rig found chemical totes next to the compressors. These totes were placed on the edge of the secondary containment with their valves hanging over the non-containment part of the pad. Suds were visible beneath the valve of the tote containing soap. This is the most probable source of the contamination.
Other areas of secondary containment were comprimised where trucks had driven over edges.
Sample 0629735 was taken in the drainage ditch on the South corner of pad.

Follow up on report of spill of dry cement on pad. Spill occured @ 10 pm on 5/21/12 when hose connection failed. Approximately 30 sks cement released on pad while cementing long string. At time of inspection Operator scraping up cement from

At the time of inspection the well was not drilled. The permit expired on 5/29/2015. The perimeter controls were in place and the site did not meet the restoration criteria of 70% uniform perennial vegetative converge. The site appeared to regraded,
Routine inspection in response to Notice of Termination filed on 9/12/2016. The NOT is disapproved and violations are being issued based on the observation made during the inspection.
At the time of inspection the Operator was not actively conducting earth disturbance. The Site ID sign was installed and the ESCGP was on site. Beginning at the township road and walking toward the well site, the access road near the gate has been backfilled to an elevation that is above the gate post and mail box (see photo). The NOT mapping indicates that the gate is to remain. The gate appears to be buried. Just beyond the gate the right side of the access road the slope is not stable and has not archived 70% uniform vegetative growth. This area also shows sign of accelerate erosion and sedimentation. The left side of the access road, which formerly contained a sedimentation basin is not permanently stabilized and shows sign of accelerated erosion and sedimentation. A large stockpile is located on the left side of the access road. An erosion rill has formed on the access road and terminates below the stockpile. The temporary BMP silt sox remains in place and does not appear to have been maintained. The orange colored silt sox is surrounded with thick vegetative growth making inspection of the BMP extremely difficult (see photo). The earth disturbance on the right side of the access road has not achieved 70% uniform perennial vegetative growth and shows signs of accelerated erosion and sedimentation. An erosion rill has formed on right side of the access road and crosses the access road. The erosion rill is approximately 200' long and has a maximum depth of 8 to 10 inches. A temporary BMP silt sox is located on the left side of the access road. The silt sock is damaged and not functioning (see photo). The disturbed area above the unnamed tributary to Trib 43603 to Fourmile Run has not achieved 70% uniform perennial vegetative growth. The disturbed area below the access road, which was formerly occupied by a sediment basin, shows signs of accelerated erosion and sedimentation. A large area of standing water was observed on the right side of the access road (see photos).
The well pad area has been reduced in size and two stock piles are located on the graveled lined well pad (see photos). Standing water was observed on the back of the well site. The area formerly occupied by the water storage impoundment appeared to be restored and showed sign of 70%uniform vegetative coverage, however the Department was unable to determine whether the vegetative growth was perennial, as the earth disturbance was conducted in June 2016. The sedimentation basin and drainage channel located below the water storage impoundment has not been backfilled or restored (see photos).
The Department also inspected the Unnamed Trib to Trib 43603 to Fourmile Run, during that inspection the Unnamed Trib indicated on the NOT as built mapping did not show sign of sedimentation impact.
The site does not match the approved post construction stormwater management plan, as the stockpiles are not illustrated on the detailed mapping. The NOT is disapproved and violations are being issued for the failure to achieve permanent

The site does not match the approved post construction stormwater management plan, as the stockpiles are not illustrated on the detailed mapping. The NOT is disapproved and violations are being issued for the failure to achieve permanent
At the time of this inspection, it appears that the Operator is actively restoring the site to pre-existing conditions.Contractors are currently performing earthmoving activities.Contractor representative Bill Steele on-site during this inspection.At time of this inspection, well reported to have been plugged on 12/18/2015.A new well permit was issued on 4/1/2016. The regulations provide that if a well site is constructed and the well is not drilled, the well site shall be restored within 9 months after the expiration of all existing well permits at the well site and/or within 9 months of completion of drilling a well, whichever is later. The regulations also provide that a well site shall be restored to approximate original conditions within 9 months after plugging the final well on the well site. Per the Department's records, the expiration of the last well permit (129-28913) will be 4/1/2017; hence, as the well (129-28913) has not been drilled at this time, the current restoration deadline for the well site is 1/1/2018 unless drilling is commenced prior to 4/1/2017 and completed with due diligence if appropriate. Therefore, violations previously issued for failure to restore the well site upon completion of drilling have been corrected upon issuance of the new drilling permit.Site ID sign on-site, visibility becoming compromised due to high vegetative growth. ESCGP-1, E&S/PCSM narratives/maps, ERP, and PPC plan located at access road entrance. Per Department records, the ESCGP-1 was previously granted an extension until 5/10/2017; this extension authorization was unable to be located.The regulations provide that an E&S plan shall be developed, implemented, and present at the project site during all stages of an earth disturbance activity if the earth disturbance activity will result in a total earth disturbance of 5,000 square feet or more. The Department was unable to locate an on-site E&S plan for the earth disturbance activities related to the restoration of the site. Per Mr. Steele, an E&S plan is not being utilized for the current earth disturbance activities.It appears that earth disturbance activities are occurring outside of the permitted LOD. Temporary BMPs also appear to have been installed outside of the permitted LOD.The Department observed what appeared to be used and/or damaged silt fence near the site ID sign. The Department recommends that the Operator properly control and dispose of unused materials in accordance with the regulations.The Department observed an area of dead and/or stressed vegetation down-gradient of a monitoring well located near the site ID sign. The Department is requesting that the Operator conduct an investigation into the cause of this dead and/or stressed vegetation and submit the findings to the Department with the NOV response. The Department recommends the Operator remediate this area of concern in accordance with the current regulations and/or appropriate Department policies. An erosion gully was observed along the length of the right side of the access road as approaching the well pad. The erosion appeared to result in the deposition of sediment into the "sediment basin" adjacent to the access road entrance. The sediment appears to have overtopped the compost sock that was installed at the base of this erosion gully.Temporary BMPs (i.e. compost sock) installed in several locations on the well site are incorrectly installed and/or maintained. Violations are being issued under failure to 25 PA CODE § 102.5(m)(5) comply with the terms and conditions of the E&S Control General Permit and under 25 PA CODE § 102.4(b)(2) and 25 PA CODE § 102.4(b)(8) for failure to have an E&S plan

At the time of this inspection, it appears that the Operator is actively restoring the site to pre-existing conditions.Contractors are currently performing earthmoving activities.Contractor representative Bill Steele on-site during this inspection.At time of this inspection, well reported to have been plugged on 12/18/2015.A new well permit was issued on 4/1/2016. The regulations provide that if a well site is constructed and the well is not drilled, the well site shall be restored within 9 months after the expiration of all existing well permits at the well site and/or within 9 months of completion of drilling a well, whichever is later. The regulations also provide that a well site shall be restored to approximate original conditions within 9 months after plugging the final well on the well site. Per the Department's records, the expiration of the last well permit (129-28913) will be 4/1/2017; hence, as the well (129-28913) has not been drilled at this time, the current restoration deadline for the well site is 1/1/2018 unless drilling is commenced prior to 4/1/2017 and completed with due diligence if appropriate. Therefore, violations previously issued for failure to restore the well site upon completion of drilling have been corrected upon issuance of the new drilling permit.Site ID sign on-site, visibility becoming compromised due to high vegetative growth. ESCGP-1, E&S/PCSM narratives/maps, ERP, and PPC plan located at access road entrance. Per Department records, the ESCGP-1 was previously granted an extension until 5/10/2017; this extension authorization was unable to be located.The regulations provide that an E&S plan shall be developed, implemented, and present at the project site during all stages of an earth disturbance activity if the earth disturbance activity will result in a total earth disturbance of 5,000 square feet or more. The Department was unable to locate an on-site E&S plan for the earth disturbance activities related to the restoration of the site. Per Department records, the ESCGP-1 was previously granted an extension until 5/10/2017; this extension authorization was unable to be located. An on-site E&S plan for the earth disturbance activities related to the restoration of the site was also unable to located.Earth disturbance activities appear to be occurring outside of the permitted LOD. Temporary BMPs also appear to be installed outside of the permitted LOD. A pile of what appears to be geotextile materials was observed on the well pad. These potentially contaminated materials are not located on secondary containment. Per current regulations, all regulated substances, including solid wastes and other regulated substances in equipment and vehicles, shall be managed within secondary containment.The area of the well pad where the Department previously observed the excavation of soil, gravel, and geotextile materials (inspection ID 2535418) appears to be filled with rock.Violations previously issued under 25 PA CODE § 102.4(b)(2) for failure to construct the well site per the approved E&S plan, under 25 PA CODE § 102.4(b)(1) for failure to properly implement and maintain E&S BMPs, under 25 PA CODE § 102.11(a)(1) for failure to properly implement and maintain E&S BMPs, under 25 PA CODE § 102.22(a) for failure to permanently stabilize site to provide protection from accelerated erosion and sedimentation, under 25 PA CODE § 102.5(m)(5) for failure to comply with the terms and conditions of the E&S Control General Permit and under 25 PA CODE § 102.4(b)(2) and 25 PA CODE § 102.4(b)(8) for failure to have an E&S plan developed, implemented, and present at the project site during all stages of an earth disturbance activity remain outstanding.

Violations are being issued under 25 PA CODE § 78a.64a(b) for failure to manage all residual wastes within secondary containment on the well site.
Additional violations may be forthcoming upon further review and investigation.
Additional comments on paper SAIR

Well operating and properly identified. E&S OK; Tank OK; However discharge of fluids has occurred. Siphon hose installed in tank. N.O.V. sent
Inspection in response to service request ID# 02-063-001.
Well operating and properly identified.
Fitting located on the bottom of produceed fluids tank is leaking.
Contacted operator by telephone.

cuttings are not all contained in the pit. Spudded the well on 3/36/07, did not cement casing until 8/20/10. Hydraulic oil leaking on ground, no attempt to fix, clean, or capture it.

Drilling is complete, well is not equipped for production. No accelerated erosion and sedimentation noted on the access road or well site. At the time of the inspection, the following deficiency was noted:
1- The well was drilled over a year ago and the well is still not equipped for production. After total depth is reached, the operator has one year to bring the well into production. If, for whatever reason, the well is idle for 12 months and no request for inactive status has been received, then the well is considered abandoned and the operator must plug it in accordance with statutes and regulations.

Contacted operator president, Mike Hahn, to clarify the status of this well. XTO Energy, Inc. is in the process of applying for inactive status for this well.

Jarrod Shultz will do a follow-up of this site to verify that the well has received inactive status.

Drilling completed 8/4/06. Well is equipped for production. Well tag in place. Tank sound. Access road is stabilized.
Inspection revealed the following deficiencies:
1) Failure to minimize accelerated erosion, maintain E&S controls, and stabilize site until total site restoration. - An erosion gully was found running down the center of the site. Washed out rut was up to 10" deep in some places. There was evidence of sediment running off the site and toward a small drainage feature that empties into an intermittent stream a short distance below the site. Several areas of the site are sparsely vegetated, and not stabilized in its present condition. Silt fence was in place, but was all torn and collapsed.
Temporary BMP's are required until the above is properly addressed and final stabilization is achieved. Once the site is stabilized all temporary BMP's must be removed.

Drilling completed 8/4/06. Well is equipped for production. Well tag in place. Tank sound. Access road is stabilized.
Inspection revealed the following deficiencies:
1) Failure to minimize accelerated erosion, maintain E&S controls, and stabilize site until total site restoration. - An erosion gully was found running down the center of the site. Temporary BMP's are required until the above is properly addressed and final stabilization is achieved. Once the site is stabilized all temporary BMP's must be removed.

Well tag in place. Well is equipped for production.
Access road is stabilized, with no signs of accelerated erosion.
Site is stabilized with vegetation. No signs of accelerated erosion on site.
Inspection revealed the following deficiency: 1) Discharge of industrial waste in the form of brine to the ground. - There was an area of dead vegetation around the bottom of the production fluids tank, as well as a large area void of vegetation that started at the tank and progressed down slope on the site. Staining and discoloration could be seen on the side of the tank above the unvegetated area indicating an overflow of fluids occurred. Tank was empty at time of inspection.

Well tag in place. Well is equipped for production.
Access road is stabilized, with no signs of accelerated erosion.

Johnathon Longwill and Adriene Smochek from Representative Dave Reed's office on site during inspection.
Well tag in place. Tank sound.
Inspection revealed the following deficiencies:

1) Failure to minimize accelerated erosion. - The access road to this well site is not adequately stabilized, and shows signs of accelerated erosion. Evidence of this was found in the washed out ditch that runs parallel to the access road, as well as large ruts and washed out areas along the roadway. Access road must be stabilized. There were also signs of erosion at the culvert that crosses over the access road and discharges onto the down-slope side of the site. Soil in this area was washed out creating a large erosion gully. This area must also be stabilized.

Johnathon Longwill and Adriene Smochek from Representative Dave Reed's office on site during inspection.

Johnathon Longwill and Adriene Smochek from Representative Dave Reed's office on site during inspection.
Well tag in place. Access road stable, with no signs of accelerated erosion.
Site is stabilized with adequate vegetation. No signs of accelerated erosion on site.
Inspection revealed the following deficiencies:

1) Discharge of brine to the ground. - Fluids were found to be leaking at a union joint on the pipe between the seperator and the production fluids tank. Fluids were found puddled under the leak. Moist areas with dead vegetation began at this point and continued down the site to just below the tank. Source of leak needs corrected, contaminated soil must be removed, and affected areas limed, fertilized, and seeded/mulched.

Received a complaint that Tub Mill Run was cloudy and had a red color. Also received a phone call from the operator stating that a Bentonite release had occurred while boring under the stream.

Jarrod Shultz and Dana Burk performed the inspection. Stacy Cox took water samples from the stream. By the time DEP representatives arrived on-site, the operator had already installed some controls to protect the stream.

Clean-up was directed by Jarod Shultz and McCutcheon Enterprises. It was decided that the operator should monitor the site for a few days.

A further DEP inspection will be performed before this VIOL can be closed.

gas in 2" vent pipe

Site ID sign and well tag in place. ESCGP-1 approval, permit and E&S plan on site.
Access road was stabilized, with no signs of accelerated erosion.
Inspection revealed the following deficiencies:
1) Failure to restore site and impoundment within 9 months of completion of drilling. Large impoundment on site has not been backfilled and restored. Not permitted as centralized impoundment. Many disturbed areas around the site and production equipment are not vegetated. Rock pad is sediment laden, and does not appear to be constructed of durable rock. 2) Failure to minize accelerated erosion, implement and maintain E&S controls, and stabilize site. Nearly all of the silt fence that was installed is collapsed. Some of the BMP's shown on ESCGP-1 were not installed. Evidence of erosion/sedimentation found on banks and around equipment. Impoundment fluids must be removed and properly disposed of. Site, pad, impoundment must be properly restored. Temporary BMP's mainta

Site ID sign in place. E&S plan on site, but not accessable due to ice in mailbox.
Access road was stabilized, with no signs of accelerated erosion.
Inspection revealed the following deficiencies:
1) Failure to restore site and impoundments within 9 months of completion of drilling. Two large impoundments constructed on site have not been backfilled and stabilized. Impoundments were not permitted as centralized impoundments, were constructed on site, and therefore must be restored within nine months of completion of drilling, along with the pad/site. Some portions of the site and impoundment perimeters are vegetated, but the majority are not. Gas line pipe, sand, and other equipment remain on site. No attempt was made to reduce the pad size. Rock pad is sediment laden and does not appear to be constructed of durable rock. 2) Failure to minize accelerated erosion, implement and maintain E&S plan, and stabilize site until total site restoration.

Site ID sign in place. E&S plan on site, but not accessable due to ice in mailbox.

Site visit was in response to notification by Steve Smith (XTO) about a release of methanol at the well site.
Steve Smith and Todd Houser represented XTO at the site.
A holding tank containing methanol was contected to the well to prevent freezing. A valve at the bottom of the tank broke spilling its contents of the tank onto the pad. It was approximated <140 gallons made it to the pad.
Less than 24 hours lapsed between the time the tank and well was inspected last.
The spill area was immediately boomed and the contaminated area was marked.
McCutcheon was on site during inpesction.
A sealed and lined roll-off box and a skid steer was used in excavating and removal of contaminated material. Numerous samples were taken (by McCutcheon) from the excavation along with one background sample.
DEP is awaiting those sample results before reclamation of the disturbed area can proceed.

Well appears to drilled and equipped for production. Well apparatus and brine tank located on site appear to be in sound condition. There was no accelerated erosion observed on access road, however there is a small collection ditch at the back si

ON 8/22/12 at 1200hrs, Steve Smith of XTO called to report a discharge of approximately 25bbls of production water from a poly tank as result of an animal (believed to be porcupine) eating a hole through tank. Release found by well tender approx

On-site inspt. Follow-up to admin inspection ID 2163388 for 4/30/13 spill incident.
A release of approx 5 bbl of crude oil was reported on 4/30/13 at 4:37pm. Opr unable to determine exact date/time of release.
Contractors, well-tender Jason, and Prod Foreman Kenon-site at time of inspection. 4 roll-off boxes along access road, 2 currently full with contaminated soils. BT previously removed from site.
BT in metal containment unit at time of release. Valve at base of containment open, resulting in oil leaking down-gradient from tank. Contractor currently digging out under and down-gradient of containment. Silt sock in place downhill from excavation.
100 bbl fiberglass production tank had a 3 foot horizontal split in its side. Believes a truck with trailer backed into tank as supported by tire tracks leading to tank and recorded distance measurements between these tracks and tank.
Company had a brine spill from this well. Went to site to watch cleanup of Brine laden soil.
Violations are being issued for reportable release of Brine.
Admin inspt. Spill report received via e-mail on 5/6/13 at 1:46pm (See Attached).
Company rep Steve Smith reported to Department a 7.5 bbl brine release discovered at 1:00pm on 5/6/13. At this time, exact cause of release unknown, believed to be hole in production tank. Tank no longer leaking. No waterways reported to be affected.
A follow-up inspection will be conducted in future to assess any environmental impacts of release and to ensure site is properly cleaned up and restored.
Violations are being issued for this reportable release of production fluids under 25 PA CODE 78.54 in addition to 78.57, 91.34 and SWMA 301.

XTO Production Foreman Ken Hoffman and contractors currently on-site. Contractors preparing site for arrival of clean-up equipment and two roll-off boxes.

Mr. Hoffman stated that while plug was being removed from valve on tank, a connection between the valve and tank split, resulting in the release.

Brine not yet infiltrated had been removed and conductivity readings were previously taken by XTO rep Erik Greenert to delineate the affected area. Site surrounded by orange security fence; readings indicate that brine did not travel outside this fence.

Site rocky. Due to current inclement weather, excavation of contaminated soils is planned to begin tomorrow morning (7/23/13).

A FUI will be conducted in the future to ensure that site is properly cleaned-up and restored.

Viols being issued for reportable release of prod fluids under 25 PA CODE 78.54 and 78.57A

Site inspection on 10/02/13 in response to reported spill. Spoke with XTO rep Erik Greenert. An undetermined amount of brine was released from tank due to two cracks at the bottom of tank. Cracks discovered by operator. Crew on hand to excavate possibly contaminated soil. Future correspondence and follow-up inspections will be handled by WQS Samantha Foulk.

UPDATE: 10/18/2013
XTO rep Erik Greenert contacted Department rep Samantha Foulk to report the quantity of release to be approximately 29-30 bbl of production brine. Operator currently awaiting leachate results of stream sampling as previously requested by Department (inspection record 2212387).

Inspection previously pending awaiting information on quantity released. Quantity has now been provided, hence violations are being issued for this reportable release of production fluids under 25 PA CODE 78.54 and 78.57(A).

Written response explaining cause of spill and timeline of remediation efforts previously received by Department on 10/15/2013.

On-site inspt as a follow-up to admin inspt (ID 2236245) for spill incident reported on 1/14/2014 in which approximately 12 bbl of brine was released from cracked brine tank.At time of inspection, brine tank disconnected from well, ready for removal from site. Roll-off boxes and excavation team not yet on-site. Well tag present, legible. According to records, drilling occurred 10/21/1985-10/26/1985.Access road stable. No accelerated erosion or sedimentation issues noted. Department recommends Operator monitor and maintain access road as increased traffic due to clean-up efforts could potentially result in an accelerated E&S pollution event.As Aultman's run is located approximately 500 feet and down-gradient from site of release, Department contacted Operator representative Jason Canose via phone following inspection to recommend that stream is sampled to ensure contaminants did not reach waters of the Commonwealth.
Violations are being issued under 25 PA CODE 78.54 and 78.57A for this reportable release of production fluids.

On Monday, January 13, 2014, the Department received a report about a spill that had occurred the previous day on XTO’s Helen Bukovac #4H site; I investigated on January 14, 2014.

The site was a Marcellus well, some production equipment and two 210 bbl production tanks floating together for a total capacity of 420 bbl (17,640 gallon); these tanks contained primarily weak brine.
Sometime during the night of January 11th and 12th the brine froze a valve causing #1 tank (the north tank) to fail. The produce water went to containment, but, since the containment was earthen it seeped through to the outside.

XTO discovered the problem during the morning of the 12th, called the Department and initiated a response. They closed in the wells, called in a vacuum truck that recovered 29 bbl of material and contracted an excavating company. They were planning on excavating until tests indicated soil to background. XTO also has plans to permanently remove the damaged tank.

crack.Occurred b/w 3/6/14 to morning of 3/10/14.Lease opr discovered on 3/10/14 at 1200.Production equipment disconnected from well.Currently excavating impacted soils, all visible oil removed.Preparing to re-locate brine tank to excavate soils underneath.Two roll-off boxes on-site, addit'l boxes to be brought on-site.As pond is located approx 125 ft down-gradient from site of release, Dept recommends sampling is conducted to ensure contaminants did not reach waters of the Commonwealth.Opr to follow Act 2 guidelines for site remediation.Drilling occurred 7/21/2010-7/27/2010.Well label present.Dept recommends Opr monitor/maintain access road as increased traffic due to clean-up efforts could potentially result in an accel E&S pollution event.Viols issued under 25 PA CODE 78.54, 78.57A & 58 PA CODE SWMA 301

NOT inspection. site not restored, erosion channels noted on two separate locations going outside the LOD. Violations noted to the ESCGP

On-site inspt in response to admin inspt 2306864 for the reportable release of 9 bbl brine water onto ground.At time of inspt, excavation not yet commenced.Brine release reported to be the result of a porcupine chewing through tank.Stressed vegetation, visibly released minimal fluids remain localized to well site.Brine appears to have traveled slightly down-gradient to level ground before "settling".Opr in process of arranging delivery of roll-off box(es) to site.Excavation of contaminated soils to commence tomorrow morning (9/25) upon arrival of roll-off box(es).Damaged BT remains on-site.WT present, legible.Drilling occurred 4/20/81-4/25/81.
Dept recom'ds Opr monitor/maintain AR in order to prevent any potential pollution events from occurring.
A FUI will be conducted to ensure site is properly remediated and restored.
Viols are being issued under 25 PA CODE 78.57A for this reportable release of production fluids.
At this time, the Department is requesting the Operator submit all disposal records and manifests upon final disposition of wastes.

Inspection in response to a spill reported by the Operator on 2/4/2015 at 13:37. The Operator reported a 5 barrel brine spill into containment at approximate 11:45 on 2/4/2015. During the inspection the Department observed an earthen dike surrou
Inspection in response to a spill reported by the Operator on 2/4/2015 at 13:37. The Operator reported a 5 barrel brine spill into containment at approximate 11:45 on 2/4/2015. During the inspection the Department observed an earthen dike surrou

fence.One covered roll-off box on-site.W/in excavated hole on bottom corner, Dept observed what appears to be a torn black liner and sand, which could be indicative of a compromised encapsulated pit. Dept collected coordinates of the observed torn liner/sand (40-53-55.1, -78-48-57.1) via a handheld GPS unit and also recorded a distance of 9 yards to the wellhead from this same location utilizing a rangefinder.Dept immediately notified Opr rep J.Canose via phone of observation.Mr. Canose will investigate to determine the location of pit encapsulation and burial and notify the Dept of findings. Dept also recommended to Mr. Canose that E&S BMPs are installed down-gradient of excavated areas as necessary.Viols are being issued for this reportable release of prod fluids. **ADD'L comments on paper SAIR**

noted.Hissing noise observed in well head vicinity.Area of excavation not yet backfilled, extends down-gradient of site.All visibly impacted materials appear removed.Booms in place down-gradient of excavation.Two covered roll-off boxes on-site.Shared AR stabilized.Dept recom'ds Opr install temp BMPs down-gradient of excavated areas as necessary in order to prevent any potential pollution events from occurring.A FUI will be conducted in the future to ensure site is properly remediated and restored.Viols issued under 78.54.Following inspection at 1034, Department notified Operator representative Jason Canose via phone of above-noted observations (i.e. smell, noise). Mr. Canose said that the Operator is aware and is in the process of resolving the issue.

base,appears sound.Site ID sign present, in compliance with Act 9.ERP, PPCP, E&S/PCSM plans, ESCGP-1 on-site.Dept recom’ds Opr install add’l rock and/or another alternative stabilization measure at outlet of first water deflector/inlet of second AR culvert as entering well site, continue to monitor/maintain all BMPs, and re-seed/mulch fill slopes to ensure permanent stabilization is maintained.Extension for site restoration previously granted until 4/8/15 (inspection record 2168010).Appears infiltration berm recently installed and/or maintained.At this time, areas surrounding infiltration berm not yet exhibiting >70% uniform and adequate veg growth.Temp BMPs installed down-gradient of infiltration berm.As site is not yet restored as per current regs, viols issued under 3216 & 102.22 for failure to restore well site.

base,appears sound.Site ID sign present, in compliance with Act 9.ERP, PPCP, E&S/PCSM plans, ESCGP-1 on-site.Dept recom’ds Opr install add’l rock and/or another alternative stabilization measure at outlet of first water deflector/inlet of second AR culvert as entering well site, continue to monitor/maintain all BMPs, and re-seed/mulch fill slopes to ensure permanent stabilization is maintained.Extension for site restoration previously granted until 4/8/15 (inspection record 2168010).Appears infiltration berm recently installed and/or maintained.At this time, areas surrounding infiltration berm not yet exhibiting >70% uniform and adequate veg growth.Temp BMPs installed down-gradient of infiltration berm.As site is not yet restored as per current regs, viols issued under 3216 & 102.22 for failure to restore well site.

security fence installed around deepest area of excavation.Two covered roll-off boxes on-site.Silt fence implemented down-gradient of excavated areas.Dept recom'ds Opr ensure silt fence is properly installed.Dept recom'ds Opr temp stabilize site and cont' to mon/maintain AR as needed in order to prevent any add'l pollution events from occurring.A FUI will be conducted in the future to ensure site is properly remediated and restored.
Viols are being issued under 78.54 for this reportable release of production fluids.Environmental Trainee CW present during inspection.Dept notified Opr rep Jason Canose on 5/29 of above-noted recommendations.Mr. Canose agreed to follow-up on these recommendations.

On-site inspt conducted in response to record 2383851 for 6/25 reportable release of 1 bbl brine water mixture from BT.At time of inspt, excavation of impacted materials not yet commenced.Roll-off box(es) not yet on-site.BT disconnected,re-located to edge of site. Area of stressed vegetation extends approx 10-15 feet down-gradient of former BT location.WT present, legible.According to records, drilling occurred 2/23/2001-2/27/2001.Dept recommends Opr cont' to monitor/maintain AR and well site as necessary and install temp E&S BMPs as appropriate prior to commencement of earth disturbance activities in order to prevent any add'l pollution events from occurring.A follow-up inspection will be conducted in the future to ensure site is properly remediated and restored.
Violations are being issued under 78.54 for this reportable release of production fluids.
odor of crude oil observed.Area of impact approx 55’x 40’ in size, extends from BT into down-gradient clearing.Appears absorbent enzyme placed on impacted surfaces near BT.Silt fence installed down-gradient of excavation.Site not yet temporarily stabilized.WT present, legible. BT appears sound.AR stable, gated.Dept recommends Opr ensure site is temporary stabilized w/in 4 days from cessation of any earth disturbance activities per current regs.Violations are being issued for this reportable release of residual fluids.
Following inspection at 1422, Department contacted Operator representative Jason Canose via phone. Department recommended that Operator ensure all visibly impacted materials are promptly removed prior to backfilling the site.

On-site inspection conducted in response to admin inspection 2386056 for the 7/1 reportable release of 35 gal brine water from brine tank.At time of inspection, all visibly impacted materials appear excavated in accordance with the Department’s Spill Policy. Area of excavation surrounded by orange security fence, not yet backfilled.Brine tank disconnected. Well tag present, legible. According to records, drilling occurred 9/10/2001-9/12/2001.Access road stable.Department recommends Operator ensure all disturbed areas on well site are temporarily stabilized within 4 days of cessation of earth disturbance activities per current regulations. Inspt conducted w/Environmental Trainee C. Witham.
At this time, the Dept is requesting the Opr submit all disposal records/manifests upon final disposition of wastes to the attention of S. Foulk at the provided address.
A follow-up inspection will be conducted in the future to ensure site is properly remediated and restored.

Violations are being issued for this reportable release of production fluids.

Incident Response Insp to Opr reported release of +/-2.5 bbls brine water:Admin Insp #2390118. At time of insp, Opr Rep. J.Canose /contractors on site. Well tag present.Bt disconnected from prod equip, moved from orig location, in secondary con
Incident Response Insp to Opr reported release of +/-2.5 bbls brine water:Admin Insp #2390118. At time of insp, Opr Rep. J.Canose /contractors on site. Well tag present.Bt disconnected from prod equip, moved from orig location, in secondary con
time of inspt, Dept observed agl activities (i.e. animal grazing) taking place on/surrounding well site; as a result, permanent stabilization has been compromised.Dept recommends Opr provide documentation showing that well site has been restored to pre-existing conditions (ag activities), and documentation from landowner stating that AR shall remain, and include who will be the responsible party for maintenance of any PCSM BMPs that may be installed.Well site restoration should be submitted to Dept no later than COB today. Two brine tanks remain on-site.Hence a viol is being issued for Opr's failure to remove all production or storage facilities, supplies, and equipment within 9 months after plugging a well.Add'l viols may be forthcoming upon verification of submittal and/or review of documentation.

On-site inspt conducted in response to admin inspt 2396559 for the reportable release of 13.5 bbl brine water.At time of inspt, excavation of contaminated materials in process, currently awaiting arrival of 2 add’l roll-off boxes.Two covered roll-off boxes on-site.Visibly impacted materials appear to be located within an approx area of 25’x30’.Temp BMPs installed around the perimeter of excavation.Opr rep Jim Zaczyk on-site.Dept recommended that, in interim, the area of excavation is covered with plastic and/or a tarp in order to prevent any further migration of contaminants should any precipitation events occur.Excavation is anticipated to be completed today, tomorrow at the latest.No nearby waterways appear to be impacted.Result of release is believed by Opr to have occurred due to ATV crashing into BT and separator.Mr. Zaczyk stated that pipes connected to the separator were disconnected and believes this resulted during the collision. Viols are being issued for reportable release of production fluids.
On-site inspt conducted in response to inspt 2396676 for 7/31 reportable release of 4.16 bbl brine water.At time of inspt, Opr rep Jason Canose and contractors on-site.BT previously emptied, disconnected, and removed from its former location.Dept observed a vertical spilt under valve of BT, which Opr believes is cause of release.Contractors actively excavating contaminated materials, utilizing a conductivity meter and visual observation as guidance.Area of excavation currently confined to former location of BT.Two roll-off boxes on-site.Dept recommended that tempBMPs are installed as necessary in order to prevent any add’l pollution events from occurring.During excavation, it was discovered that crude oil had also been released.Dept requested an updated quantity of substances released be provided to the Dept. Violations are being issued under 78.54 for this reportable release of production fluids.
**ADD'L COMMENTS ON PAPER SAIR.
see hard copy for comments.
On-site inspt conducted in response to admin inspt ID 2409106 for reportable release of brine water.At time of inspt, excavation of impacted materials in process.Three roll-off boxes on-site.Opr rep J. Zaczyk on-site.Release estimated to be <1 bbl,
On site for complaint inspection. XTO self reported a 22 gallon flowback water spill on well pad. A contractor was removing a 4 inch line that led to spill. Spill area was not on containment. Contaminated soil removed via excavator and disposed of. N

Inspection performed in response to reported release of 8 barrels of brine-produced water by the Operator on 9/24/2015 at 10:38am (Inspection ID# 2409995). Clean-up procedures have been initiated by Operator. The compromised brine tank has been disconnected from wellhead apparatus and moved to edge of well site. Approximate 60'x30' area of impact has been excavated of immediate impacted material. A smaller 10'x10'x10' area where the compromised brine tank was previously located has also been excavated. All excavated materials stored in 8 securely covered roll off containers. Well site located approximately 250ft up gradient of Muddy Creek. At the time of inspection no evidence of the release impacting the waterways was noted. At the time of inspection, potentially encapsulated drill pit does not appear to be compromised as referenced in inspection ID 2410537. Perimeter temporary E&S BMPs properly installed and site temporarily stabilized.
SEE ADDITIONAL COMMENTS ON PAPER SAIR
Incident Response Inspection in response to Inspection ID # 2417916 for Operator reported release of 5 bbl of brine.
Operator indicated to Department that amount of reported release may have been misreported; therefore additional information will be provided to verify quantity released (see Inspection ID #2417938).
At time of inspection well tag present. Brine tank moved to enable excavation of soils. Impacted soils removed to a roll-off box. Roll-off box removed from site and located at nearby well site, William C. Widdowson 3 (permit number 063-35217).
Excavated area approximately 8' by 6' surrounded by security fence. No temporary BMP's in place. Department recommends Operator monitor site and install temporary BMP's as necessary.

Violations being issued: Operator discharged brine or other fluids on or into the ground or into waters of the Commonwealth and

Failure to properly store, transport, process or dispose of a residual waste.

Failure to properly store, transport, process or dispose of a residual waste.

At the time of this inspection, the well is plugged with the permit number affixed to an erected monument. According to Department records, this well was drilled between 5/24/2007-12/7/2007, inactive status was granted on 7/16/2009, and this well was plugged on 1/13/2015. The Department's regulations provide that a well site must be restored within 9 months of completion of plugging of a well; therefore the restoration deadline for this site was 10/13/2015. During today's inspection, the well site is not exhibiting 70% uniform and adequate vegetative growth; specifically, there is an area southwest of the plugged well along the access road that is approximately 26 yards x 19 yards in size that appears to have been recently seeded and mulched with minimal growth observed.Violations are being issued for failure to restore the well site within 9 months of plugging the well and for failure to have an E&S plan on-site for all stages of an earth disturbance activity.

On-site inspection conducted in response to admin inspection 2452583 for the 2/23 reportable release of 28 gal brine from rotted drip line.
Operator representative Jason Canose and contactors on-site.
At time of inspection, all visibly impacted materials appear excavated in accordance with the Department's Spill Policy. One covered roll-off box on-site.
Brine tank disconnected and moved to edge of well site. Well tag present, legible. According to records, drilling occurred 4/29/1986-5/03/1986.
Department recommends Operator ensure all disturbed areas on well site are temporarily stabilized within 4 days of cessation of earth disturbance activities per current regulations, temporary E&S BMPs are properly implemented as necessary, and the access road continues to monitored and maintained as needed.
A follow-up inspection will be conducted to ensure site is properly remediated and restored.
Violations are being issued for this reportable release of production fluids.

This well is not equipped for production - has been shut in for several years and no application for inactive status has been made by Operator. NOV issued for failure to plug an abandoned well.

At time of inspection Department observed water flowing across access road before reaching well site. Water is creating erosion gullies on access road. Culvert pipe under access road appears to be unmaintained.
No E&S issue observed on site.
Well label present. Brine tank appears structurally sound.
Well appears equipped for production.
UPDATE 5-24-16: Department contacted Operator Rep Jason Canose by phone. Mr. Canose stated he would check out the access road and address any issues.

Violation being issued for failure to maintain E&S BMP's.
At the time of this inspection, Marcellus well (063-36434) drilled and appears equipped for production.Site ID sign installed.ERP,PPC Plan,as-built on-site.Dept is unable to locate ESCGP-1 and E&S/PCSM plans,including most recent minor mod ap
At the time of this inspection, Marcellus well (063-36827) drilled and appears equipped for production.Site ID sign installed.ERP,PPC Plan,as-built,E&S/PCSM plans,including the most recent minor modification approved by the Department on April
Incident Response Inspection in response to an Operator reported release of approximately 20 gal of brine. (Inspection record #2503100).
At time of inspection well tag present.
Contractors on site had just completed excavation of impacted soils.
Brine tank unattached from production equipment and moved to entrance of site. Department noted corrosion on valve of brine tank. Area of release appears to be excavated to approximately 8 feet deep. Contractor stated the soil was tested with a soil probe to determine how deep to excavate. Area of excavation approximately 10 feet by 10 feet. Roll off box on site containing recently excavated soils.
Department spoke with Operator Rep Jason Canose by phone to determine how release amount was calculated. Mr. Canose stated he would provide Department with that information.
Department recommends Operator install temporary BMP's downgradient of site to avoid any E&S issues. Department also recommends Operator continue to monitor and maintain access road to avoid any E&S issues.
Violation being issued for Operator discharge of brine or other fluids on or into the grounds of the Commonwealth.

On 08/11/16 at approximately 1330 hours I conducted an incident response inspection of the Stevens drip tank in response to a spill that occurred on 07/22/16. The brine tank was punctured by a projectile, allowing approximately 8.3 barrels of produced water to spill onto the ground surface. The fluid is reported to be such a low concentration that it is capable of freezing, but no water samples were taken from the tank to confirm the concentration. XTO staff utilized a soil probe to test for the extent of the spill, but reportedly the soil readings were comparable to background. XTO is awaiting soil sample results from ESL labs. The following violations have resulted due to the spill:

Outstanding Violation 767828
Arrived at 12:50. Weather: sunny. Workover rig onsite. Met with Mike Hahn (company man). Rig moved in last night to snub in more tubing at the Temple 8541, in an effort to improve production. The well was killed with 30 bbl brine. At the time of my inspection, the rig was pulling tubing to put NX nipple in place for tubing plug. The other well onsite, the Temple 8496 was shut-in for these operations which were targeted for completion on 12/8/16. No violations were noted during this inspection; however, a violation of §78.86 was cited on 7/7/11 (IR# 1987470). For this reason the result of this inspection is, OUTST.
Left @ 13:20.

On-site inspection conducted in response to admin inspection 2544979 for the reportable release of 13 bbl brine water to the ground.
At time of inspection, well-tender Jeff Heilburn and contractors on-site. Excavation of contaminated materials not yet commenced. Due to snow-cover, the Department was unable to observe the area impacted by the release.
Per Mr. Heilburn: No snow was on-site yesterday (12/13) when the spill was discovered. The release appeared to extend to the right of the brine tank when standing at the well head. The release of 13 bbl brine water resulted from a corroded valve on the brine tank.
While on-site, contractors moved brine tank in preparation for excavation of impacted soils. Two roll-off boxes on-site.
Department recommends Operator properly install temporary E&S BMPs as necessary in order to prevent any potential pollution events from occurring.
Access road has been plowed.
Well tag present, legible. According to records, drilling occurred 12/22/2003-12/28/2003.

Well head leaking fluid killing vegetation in a path down slope of well head for approximately 50 feet. Water samples taken in puddle 4 feet from well. NOV issued.

sedimentation of UNT Wallace Run (EV)

spill occurred as the pump feeding the Frac on GU 10 pad from C Pad Large Impoundment suffered a fatal crack causing a brief vertical shower. The pump was immediately shut down. Approximately (70) gallons spilled onto containment. Approximately (3) gallons were discharged in the brief vertical shower. The area was cleaned up immediately and taken to an appropriate facility for disposal. New modified rock was put down. The Department was notified of the release at 18:52 on 12/18/12. I recorded an over the limit conductivity reading on the secondary containment liner where the pump equipment is stored at the site; and in (2) areas of ponded of water off containment near this equipment and where the excavation of the release took place.

We watch a few trucks enter the access road and there was some dust; most of the water truck traffic approach the site from the south (South Main Street Extension & Route 19 intersect about a mile and further down the road). We stopped at the farm approximately ¼ mile south of the plant entrance and found and photographed what looked like limestone splatter on the vegetation and on a road sign. Based on this, Range Resources has failed to keep sediment within their prescribe limits of disturbance.

2-4 barrel frac fluid spill on 14 SEP, onto liner
~50 brls drill cuttings release from truck rollover
Dust suppresant got into stream

Checked on site. Impoundment nearly empty, the comapny is adding monitoring wells and insturments. Found a spill and cited violations.

Steve Watson, Environmental Health and Safety Specialist of Cabot Oil and Gas contacted me at 10:34 AM on 3/1/16 to report the discovery of staining on the pad surface along with an odor of diesel fuel. The staining and odor was discovered on 2/29/16 as Cabot had removed the liner used during drilling operations. Mr. Watson stated that on 1/28/16 an estimated (3) barrels of diesel based drilling mud was recovered from secondary containment. The mud was released through a hole in a Diaz half round container. The Department was not notified of the spill to containment that occurred on 1/28/16.
Last week Cabot discovered dark staining on the liner used during drilling as they were removing rig mats set on top of the liner. As the liner was pulled from the pad surface yesterday around 2PM, staining was discovered on the pad surface due to compromised liner integrity. A smell of diesel fuel was detected as the liner was removed from the pad surface. Spots of dark staining on the pad surface were observed near the well grates on 3/1/16.

STA#384

Summary Report states the following information; Resource on behalf of Cabot mobilized to the site later in the day on 3/30/16 to evaluate soils. They had identified an excavation measuring approximately 7'X3' x 1-2" on the east side of the access road approximately (83) feet form SR 2024. They collected (3) samples in the same locations as the Department had collected samples on the lease road. Concentrations of ethylene glycol exceeded the Statewide Health Standard (SHS) residential, used-aquifer (R-U) Medium Specific Concentration (MSC) in two (2) of the three (3) samples. Based on these results, additional soil remediation was scheduled by Cabot.

Ethylene Glycol was reported at (6,840) mg/kg in sample number 4559-213 and (2,940) mg/kg in sample number 4559-214, both samples collected by the Department. The PA statewide health standard for ethylene glycol is (1,400) mg/kg.

The Remediation Summary Report states the following information; Ethylene Glycol in sample number 002 was reported at (3,980) mg/kg and sample number 003 was reported at (3,100) mg/kg. Sample numbers 002 and 003 were collected by Resource. Resource retuned to the location on 4/14/16 to perform additional soil remediation in the impacted area where concentrations of ethylene glycol exceeded the statewide health standard. GDS used a backhoe to expand the area remediated on 3/25/16. Resource used visual and olfactory (sense of smell) and an ethylene glycol screening kit to evaluate soil. Field screening performed upon completion of the excavation process did not indicate a presence of ethylene glycol on the lease road. The impacted material was placed into a lined (30) cubic yard roll-off container. Resource re-sampled the same areas of the lease road sampled on 3/30/16 upon completion of the excavation. Ethylene glycol was not detected in sample numbers 002 A and 003. The cleanup activity at the site and the results of the confirmatory sampling demonstrate that no additional remedial action is warranted related to this release. A total of (3) (55) gallon capacity drums of the impacted material/waste generated on 3/25/16 was transported to Waste Recovery Solutions, Inc. in Myerstown, PA. An estimated total of (10) tons of the impacted material/waste generated on 4/14/16 was transported to Tunnel Hill Reclamation Landfill in New Lexington, OH.

Summary Report states the following information; Resource on behalf of Cabot mobilized to the site later in the day on 3/30/16 to evaluate soils. They collected (3) samples in the same locations as the Department had collected samples on the lease road. Concentrations of ethylene glycol exceeded the Statewide Health Standard (SHS) residential, used-aquifer (R-U) Medium Specific Concentration (MSC) in two (2) of the three (3) samples. Based on these results, additional soil remediation was scheduled by Cabot.

Ethylene Glycol was reported at (6,840) mg/kg in sample number 4559-213 and (2,940) mg/kg in sample number 4559-214, both samples collected by the Department. The PA statewide health standard for ethylene glycol is (1,400) mg/kg.

The Remediation Summary Report states the following information; Ethylene Glycol in sample number 002 was reported at (3,980) mg/kg and sample number 003 was reported at (3,100) mg/kg. Sample numbers 002 and 003 were collected by Resource. Resource retuned to the location on 4/14/16 to perform additional soil remediation in the impacted area where concentrations of ethylene glycol exceeded the statewide health standard. GDS used a backhoe to expand the area remediated on 3/25/16. Resource used visual and olfactory (sense of smell) and an ethylene glycol screening kit to evaluate soil. Field screening performed upon completion of the excavation process did not indicate a presence of ethylene glycol on the lease road. The impacted material was placed into a lined (30) cubic yard roll-off container. Resource re-sampled the same areas of the lease road sampled on 3/30/16 upon completion of the excavation. Ethylene glycol was not detected in sample numbers 002 A and 003. The cleanup activity at the site and the results of the confirmatory sampling demonstrate that no additional remedial action is warranted related to this release. A total of (3) (55) gallon capacity drums of the impacted material/waste generated on 3/25/16 was transported to Waste Recovery Solutions, Inc. in Myerstown, PA. An estimated total of (10) tons of the impacted material/waste generated on 4/14/16 was transported to Tunnel Hill Reclamation Landfill in New Lexington, OH.

At time of inspection site ID sign present. PPC plan, E&S log/checklist, Master containment plan, Site Restoration plan, Emergency Response plan and ESCGP-1 on site.
Marcellus site with one well on pad.
No E&S issues observed on shared, gated access road. Well pad rocked, no E&S issues observed.
It appears a road has been created to the east of the well pad, between the pad and sediment trap. This road is within the LOD and not on the ESCGP-1.
According to Department records, Major Modification to ESCGP received on 10-16-14 but later withdrawn by Operator. Therefore the 10-14-2011 approved restoration plan is the plan the Operator is responsible for implementing.
An NOT for this site has not been received by the Department. At this time the ESCGP-1 has expired. As a result, if Operator intends any earth disturbance >5 acres at this site, Operator must apply for a new permit.
Violation being issued for failure to submit NOT to Department.
Violation being issued for failure to comply with the terms and conditions of the E & S Control General Permit.
Admin inspection to inspection record #2538438 where violations issued for failure to submit NOT to Department and for failure to comply with the terms and conditions of the E & S Control General Permit.
Operator Rep Jeremy Manno contacted Department by phone in response to the above mentioned NOV. Mr. Manno stated an extension was requested for the ESCGP-1. Department recommended Mr. Manno contact his consultant to determine status of the extension and follow up with Department.
As per the 11-15-16 NOV, the Department is requesting the Operator respond in writing to the NOV by 12-12-16. The Operator should include explanation of the cause of violations, explain what Operator has done, or will do to correct the situation, and include a schedule or anticipated time frame for compliance.
Previously issued violations still exist for this site.
Admin inspection to inspection record #2538438 where violations were issued for failure to submit NOT and failure to comply with terms of E&S General Permit.
Department contacted Operator Rep Jeremy Manno to address questions raised by Operator about possible plugging of the EP Bender CC-03C 1H well.
Operator inquired as whether they would be required to restore well site to restoration plan upon plugging if landowner (mining company) proposed earth disturbance within the well pad LOD.
Department stated that Operator is required to submit NOT and that on-site conditions shall match approved NOT or near original contours, unless otherwise approved by the Department (submittal of Landowner Consent: Post-Plugging Well Site Restoration Form).
Operator is responsible for BMP's until NOT is approved.
Department received response to the NOV from Operator.
In NOV response Operator states that an extension for the ESCGP-1 was submitted to the Department on 10-5-16 and that the Operator is awaiting a response from the Department. This document is provided in the NOV response. Upon review of the document, it appears the document submitted was a Well Site Restoration Extension, not an ESCGP-1 extension.
Operator also stated the road created east of the well pad was created by EP Bender Coal Co Inc. under their DEP approved mining permit.
Previously issued violations still exist for this site.
Department received response to the NOV from Operator.
In NOV response Operator states that an extension for the ESCGP-1 was submitted to the Department on 10-5-16 and that the Operator is awaiting a response from the Department.
