13.7 Conclusion
13.1 Introduction
The NT Budget 2017–18 estimates that the NT population is approximately 245,000, which equates to 1% of Australia’s population. The structure of the NT’s economy substantially differs from that of the national economy, reflecting its abundant natural resources, a large public sector, a sizeable armed services presence, and a small private sector that is significantly influenced by major projects.¹

Over the past 12 years, the NT economy has benefited from multiple major projects. Gross State Product (GSP), often referred to as real output, has grown from $15.2 billion in 2004–05 to $25.4 billion in 2016–17. However, economic growth is forecast to be moderate as the Territory moves from investment-led growth to predominantly export-driven growth. The relatively modest rate of growth in the short term reflects a transition to more historical levels of private investment.²

The Australian Petroleum Production and Exploration Association (APPEA) argued that resource development brings the potential for a substantial and stabilising public benefit. It further asserts that new industries are needed to support the NT economy as the Ichthys LNG project transitions from construction to production.³ Multiple submissions from industry described the potential for substantial benefit to the Territory’s economy by the development of an onshore shale gas industry based on the geological extent of prospective source rocks. For example, Falcon Oil and Gas Australia, which holds a 30% interest in exploration permits EP 76, EP 98 and EP 117 (located in the Beetaloo Sub-basin), submitted that, "economic benefits cannot be quantified due to the infancy of the discovery and the need for further appraisal. However, should the project advance, it would contribute to economic prosperity for decades to come through direct jobs on a range of skill levels and indirect jobs through the ‘multiplier effect’ when a new industry is created."⁴ Other submissions outlined how the growth of an onshore shale gas industry in the NT would see the establishment of supply hubs (a centre for excellence or other educational centres) that provide an avenue for local people to obtain training, development and accreditation for employment in the gas industry and other sectors.⁵

There is, however, considerable community concern that any onshore shale gas industry could have significant negative economic consequences, including a rapid increase in the cost of living for Territorians not involved in the industry, exacerbation of existing issues of inequality and disadvantage, and reductions in the financial viability and sustainability of existing businesses.⁶ Many submissions expressed a concern that a shale gas industry in the Territory was unlikely to provide significant economic benefit and comes with substantial risks.⁷

13.2 Key issues
The final list of issues lists seven possible economic risks, including cumulative impacts, that are associated with any development of onshore shale gas reservoirs in the NT (see Appendix 2).

The Panel has received a variety of submissions on how the development of any unconventional shale gas industry might benefit or have an adverse impact upon the Territory’s economy. The following discussion provides additional detail around known risks and proposed measures to mitigate those risks.

13.2.1 Distribution of potential economic benefits
Origin describes an extractive business’s role as that of a developer, namely, to “[f]acilitate the transformation of a natural asset, which is a publicly owned good, into social or economic benefit for

⁷ The Australia Institute, submission 539 (The Australia Institute submission 539), p 3.
However, multiple submissions indicate that there is still significant public concern regarding how the revenue generated from potential future gas sales will be managed and divided. NTCA stated that, "equilibrium must be imbued, so that both landholders and tenement holders’ rights and interests in the land are balanced, ensuring dichotomous entitlements and rights to economic benefits are fairly and adequately accommodated" and that, "advantages which flow from the access and use of the land to obtain resources (minerals/petroleum) beneath the surface of the soil are for the benefit of the resource tenement (profit) and the Northern Territory (licence fees and royalties), however is to the detriment of the landholder, who under the current Northern Territory regime, is only entitled to compensation where damage or loss arises after the Authorised Activities."

It is for this reason that the NTCA proposes that a tenement holder should not be entitled access to private leasehold land without first "obtaining written consent of the landholder by way of a conduct and compensation agreement (valid for no more than one (1) year), including provision for compensation payable by the tenement holder to the landholder as a result of the disruption / disturbance / granting of the right to enter the land for the purpose of undertaking necessary investigative or more intrusive activities."

13.2.1.1 Government revenue

Approximately 70% of the Government’s annual income comes from the Commonwealth, with the remaining 30% from the Territory’s own source of revenue. Changes to Goods and Services Tax (GST) funding allocation and national economic volatility have the potential for a greater negative impact on the NT’s financial sustainability. Growing the NT’s financial base will reduce this risk, by reducing the NT’s reliance on the Commonwealth.

While multiple submissions support onshore shale gas development as a means of gaining greater independence from the Commonwealth and to strengthen the NT economy, The Australia Institute nevertheless noted that, "mining and gas royalties are not a major source of funding for Australian state and territory governments." It describes declining payments received under the Petroleum Resource Rent Tax and went on to say that, "balanced against the modest increases in revenue, costs that accrue to the state through infrastructure provision and other forms of subsidy need to be considered."

13.2.1.2 Employment

In its 2015 report, Deloitte Access Economics (Deloitte) presented two scenarios (success and aspirational) for potential onshore gas development in the NT. Associated predictions for employment were between 4,200 and 6,300 full time equivalent (FTE) jobs above the base case by 2040.

Industry has expressed an intention to invest in providing local training, jobs and business support, particularly in remote and regional areas. Origin stated that its ‘approach to living local and buying local will ensure economic benefits accrue in our areas of greatest activity and impact.’ Pangaea also advocated an approach that supports a long-term focus towards community integration. Examples of ‘local content’ provided in its submissions include employing pastoralists in seismic operations, Aboriginal people in civil access and construction works, local civil earthworks.

contractors, local waste disposal companies, and local camp and accommodation companies.\textsuperscript{17} Multiple submissions received from a variety of Territory-based businesses agreed on the need for local content with respect to employment.\textsuperscript{18}

The NLC advises that many Aboriginal communities are remote and are largely dependent on welfare. Its submission describes how a “mature and well-designed onshore oil and gas industry” offers the potential to address a number of economic pressures through potential income streams, including business development, training and direct employment.\textsuperscript{19}

However, a range of submissions questioned the long-term employment benefits to rural and remote communities in the event that any onshore shale gas industry is established. Models reliant on a largely FIFO workforce were widely criticised by the community during consultation sessions for their lack of contribution at a community or regional scale. The Northern Territory Chamber of Commerce and Industry also highlighted its concerns around the potential use of FIFO workers, demanding that gas companies be socially responsible by avoiding the use of such a workforce in order to maximise local employment and business opportunities.\textsuperscript{20} The Australia Institute expanded upon these concerns, predicting that Territorians will have to compete with the many experienced workers no longer employed in the Queensland CSG sector as a result of that industry’s decline since 2015.\textsuperscript{21}

\subsection*{13.2.1.3 Purchase of local goods and services (indirect economic contribution)}

Origin states that production royalties would substantially increase and diversify the NT revenue base without affecting critical existing industries, such as cattle exports and tourism. Its submission argues that employees of local extractive businesses and their contractors buy locally, and they pay for local services including education, health services, transportation, accommodation, food and entertainment.\textsuperscript{22} Having said this, the Panel notes concerns raised by the public that the presence of the gas industry in the community could cause the price of food, goods, and services to increase. Localised inflation was also raised as an issue by the NLC.\textsuperscript{23}

\subsection*{13.2.1.4 Infrastructure development and induced economic effects}

Origin references advantages provided by improved civic infrastructure and increased cash flow through local communities that will result from investment in any onshore shale gas extraction. Its view was supported by local submissions. Mr Mark Sullivan described required infrastructure and the potential for development through the support of the oil and gas sector, for example, bitumen roads, bridges, regional power generation and distribution, communications, health centres and education facilities.\textsuperscript{24} The Darwin Major Business Group stated that development of any onshore shale gas industry will attract investment in roads and regional infrastructure and deliver significant long-term benefits and opportunities to businesses and regional communities across the Territory.\textsuperscript{25} Conversely, the NTCA cautioned that in underdeveloped regions where there is limited infrastructure, substantial capital costs may deter valuable private investment.\textsuperscript{26}

The NLC advised that community infrastructure and development benefits that can be negotiated as part of a production agreement may assist in fostering community development and help ease the economic pressures currently faced in remote, and too often welfare dependent, Aboriginal communities.\textsuperscript{27}

\subsection*{13.2.1.5 Royalties}

The NT Petroleum Royalty Overview provided by the Department of Treasury and Finance stated that “royalties are payments made to the Northern Territory Government as the owner of the petroleum, in consideration of a right granted to extract and remove petroleum and are calculated at the rate of 10\% of gross value at the well head on petroleum production. The Territory’s royalty

\end{itemize}
regime encourages present and future exploration and development of petroleum resources. At the same time, it compensates the Northern Territory community for allowing the private extraction of the Northern Territory’s non-renewable resources."  

During community forums held by the Panel, questions were raised about how royalties would flow through to local communities that would be bearing the risks of any onshore shale gas industry. Many members of the public requested that a ‘Royalties for Regions’ program should be considered. The NTCA, for example, argued that, “a policy similar to the Western Australia Royalties for Regions program, to ensure economic benefits generated as a result of the unconventional gas industry are invested into the communities affected by the shale gas projects. Benefits should be in the form of investment in infrastructure and long term capital assets.”

### 13.2.2 Property values

Multiple submissions referenced the negative influence of any onshore shale gas development on, and in close proximity to, residential and agricultural properties. Examples of the presence of CSG wells in Queensland leading to reduced property values and subsequent refusals by banks to accept those properties as security for finance or bridging loans were given. The Panel notes, however, that this evidence has been challenged by the Commonwealth Bank of Australia.

Lock the Gate Alliance also cited a 2011 submission by Rabobank Australia and New Zealand to the Australian Senate Inquiry into Management of the Murray-Darling Basin to the effect that, “until such time as the comprehensive, detailed investigations into CSG exploration, mining and production activities are carried out, Rabobank is not able to opine as to whether the agriculture and energy industries can coexist.”

But the notion of declining property values has been rejected by some stakeholders on the basis that infrastructure improvements can benefit remote cattle stations. For example, Mr Rohan Sullivan of Birdum Creek Station advised of “understandable anger” in relation to the current moratorium because it had halted Pangaea’s 2016 infrastructure program worth $100 million, including the commencement of the Western Creek Road upgrade in the Sturt Plateau. According to Mr Sullivan, other positive investments made by Pangaea included the installation of monitoring equipment in bores, the identification and mapping of a deeper aquifer that was previously only poorly understood, and LIDAR assessment of the area to assist with developing road infrastructure that will also assist with on-station dam development.

Increases in housing values driven by ‘boom’ periods may have both positive and negative outcomes. CSIRO stated that increased housing values may be seen as a positive outcome for the owner of a house, but a negative outcome for someone seeking to purchase a house. Locals may not benefit from the direct income increases and may instead suffer from increased rents, poverty, and outmigration, especially in lower income households.

In a 2016 report to the Council of Australian Governments, APPEA stated that there was no clear quantitative evidence that the onshore gas industry was having an impact, whether negative or positive, on rural property values. However, APPEA did report that the Queensland GasFields Commission had identified some rural property listings that had underlined the benefits of the value of compensation payable by the CSG industry to those properties and the economic opportunity that comes from being located in proximity to the gas industry.

APPEA also opined that resolving housing pressure is clearly a matter of balance when a temporary workforce is involved. Communities will be keen to maximise the benefits that can accrue to resident workers rather than non-resident (or FIFO) workers. This shift will increase pressure on the existing stock of housing and will require new residences to be built. But once the workforce peaks, and employment opportunities decrease, excess housing supply can cause

13.2.3 Impact on other industries

13.2.3.1 Reduced revenue and competition for resources

The Arid Lands Environment Centre (ALEC) stated that, "shale gas will compete for access to resources within the dominant agricultural, pastoral and tourist industries of the Northern Territory." It specifically cited land and water access constraints that were required for continued livelihood. The NTCA submitted that, "many of the areas targeted by tenement holders are rich agricultural areas with valuable water resources. Ideally, neither right to land should supersede the other." It acknowledged that the considerable shale gas reserves located within the NT provide significant economic enticement to the Government (present and future), however, it noted that, "fossil fuel reserves are finite, while livestock production and agriculture generally will operate in perpetuity." Consolidated Pastoral Company Pty Ltd advised that, "any adverse impacts on access to groundwater or the quality of groundwater would have a significant impact on the company and the Territory pastoral industry. Further any changes in land use on pastoral leases that limit the carrying capacity of the lease would have an adverse impact on the viability of the enterprise." Lock the Gate listed the deleterious impacts of known onshore unconventional gas development on agricultural land as, "intensification, fragmentation, disruption to agricultural operation and alienation of agricultural land, large water demand, vegetation clearing and the production of polluting waste." In relation to CSG development, it observed the potential for further economic losses from disruption of agricultural operations, spills and leaks of wastewater, or the spread of weeds.

In addition, tourism is a large driver of the NT economy. It was regularly stated that, "our long-established reputation as a unique tourism destination centered around our extraordinary natural landscapes and rich aboriginal culture" may be affected by the onshore unconventional oil and gas industry. The tourism industry in Central Australia is described as being highly vulnerable to any onshore shale gas development because of the brand perception that it has "pristine, wild and natural landscapes." Tourist operators from Mataranka expressed concern regarding the viability of the tourism industry, in particular, the impact any onshore shale gas industry might have on the Roper River region and the water source that tourism operators rely upon. The Amateur Fishermen’s Association of the Northern Territory (AFANT) reiterated the economic and social value of the recreational fishing industry to the Territory:

"given the reliance of the Northern Territory’s world class recreational fisheries upon intact water resources/ healthy ecosystems, and the significant, well established and sustainable social and economic benefits of the recreational fishing sector, it is clear that unconventional gas development presents risks that must be taken seriously."

13.2.3.2 Regional employment

A review of the socioeconomic impacts of CSG in Queensland by the Office of the Chief Economist stated that,

"there is evidence that some of the employment in the CSG sector has been drawn from other industries, as the growth in employment in CSG has been associated with a reduction in agricultural employment. However, the latter decline could also be attributed to drought, increased mechanisation, and a trend toward consolidation of farm ownership."
The review hypothesised that negative shifts from the agricultural sector could be a result of direct migration into mining jobs or because of high labour costs encouraging a move toward less labour-intensive agriculture. The review described the limited availability and increasing cost of rural labour experienced by farming communities as a result of competition from CSG companies, especially at peak times such as planting and harvest.\textsuperscript{51}

\subsection*{13.2.3.3 Environmental remediation}

Multiple submissions raised the potential for groundwater and surface water pollution, land pollution, and air pollution, through various contamination pathways. The cost associated with either remediation, or potentially irreversible environmental damage, is understandably a significant issue for the community, particularly where those costs are perceived to be likely to be borne by the public (that is, Government or local authorities), and not the gas company responsible for the pollution and harm. This potential cost must be considered when determining whether any onshore shale gas industry will result in a net economic benefit to the NT.\textsuperscript{52}

\subsection*{13.2.4 Energy security}

Multiple submissions described how the NT’s entry into a potentially volatile global gas market could have implications on local electricity prices. According to The Australia Institute, “potential connections to the chaos of the Eastern Australian market, or expansion of export facilities in Darwin” is “the biggest threat to security of gas supply in the Northern Territory.”\textsuperscript{53}

Many submissions referenced the 2016 report Pipe Dream, A Financial Analysis of the Northern Gas Pipeline published by the Institute of Energy Economics and Financial Analysis. That report concluded that the “construction of the North East Gas Interconnector (NEGI) is being proposed at a time in which global liquefied natural gas (LNG) markets are in a glut. The NEGI deal—if it were built—would occur under a monopoly arrangement whose economic benefits, if there are any, would be limited to foreign owners.”\textsuperscript{54} In response, Deloitte argues that the experience of the US suggested that shale and tight energy sources will play a vital role in meeting future demand.\textsuperscript{55}

The NTCA proposed that the Panel investigate the merits of a gas reservation policy on behalf of all Territorians to ensure that NT residents have access to clean and affordable gas in the foreseeable future.\textsuperscript{56} Conversely, other submissions argued that, “fracking will inhibit investment and growth in the renewables sector.”\textsuperscript{57}

\subsection*{13.3 Modelling economic impacts of hydraulic fracturing}

To meet its Terms of Reference (see Appendix 1), the Inquiry is required to determine the economic risks and impacts of hydraulic fracturing in the NT. The Inquiry therefore engaged an economic consultant, ACIL Allen Consulting Pty Ltd (ACIL Allen), to assess the economic risks and impacts of hydraulic fracturing in the NT. The Panel had oversight of all aspects of the consultancy, from preparing the scope of services (see Appendix 18), to approving assumptions and clarifying the update scenarios to be modelled.

The remainder of this Chapter discusses the modelling process and provides an overview of ACIL Allen’s key modelled results from its report, The Economic Impacts of a Potential Shale Gas Development in the Northern Territory (at Appendix 17).\textsuperscript{58}

It must be noted that all economic modelling involves applying a set of assumptions to quantitative models, and is therefore subject to uncertainty and should be treated with caution. ACIL Allen advises that the modelling undertaken for the Inquiry is subject to higher than usual uncertainty because the development of any onshore shale gas industry in the NT is at such an early stage.

13.3.1 Engaging ACIL Allen

In April 2017 the Inquiry released a public tender for an economic impact assessment of the potential onshore unconventional gas industry in the NT. The tender documentation required an assessment under the following three scenarios:

- **scenario 1:** (the baseline scenario): where the moratorium on hydraulic fracturing of unconventional shale gas reservoirs remains in place;
- **scenario 2:** the development of the onshore unconventional shale gas industry in the NT; and
- **scenario 3:** the development of unconventional shale gas reservoirs in the Beetaloo Sub-basin only.

Also required to be considered were the:

- economic risks associated with the three development scenarios, describing the actual and possible adverse impacts on and risks to the NT economy under the current regulatory regime; and
- the impacts of development on other industries in the NT, such as tourism, agriculture, horticulture and pastoralism.

Six tenders were submitted, which were carefully assessed against the NT Procurement framework. The tender was awarded to ACIL Allen. The cost of the tender was $287,719.

13.3.2 Change to the scope of works

The development scenario modelling sought to identify what would happen if the moratorium was lifted by the Government. However, early in the consultancy it became clear that there was very limited information regarding the shale resource given the embryonic stage of shale gas development in the NT. To date there has been one fracture stimulated horizontal well that has been tested in a near-production setting, namely, Origin’s Amungee NW-1H well in the Beetaloo Sub-basin. This well has delivered a positive production test result, but significant further testing is required to determine the scale, scope and qualities of any shale gas production potential in this Sub-basin alone, irrespective of the remainder of the NT.

In consultation with the Panel, ACIL Allen modified the initial scope of works to undertake economic modelling on the following development scenarios over a 25-year timeframe:

- **Baseline scenario:** the moratorium remains and nothing changes;
- **Calm scenario:** the moratorium is lifted, but only exploration and appraisal activity occurs for a period of three years and development is found to not be commercially viable;
- **Breeze scenario:** the moratorium is lifted, exploration and appraisal activity occurs and a small-scale development (100 terajoules per day (TJ/day)) (or 36.5 PJ per annum) takes place;
- **Wind scenario:** the moratorium is lifted and a moderate-scale (400 TJ/day) (or 146 PJ per annum) development occurs; and
- **Gale scenario:** the moratorium is lifted and a larger-scale (1,000 TJ/day) (or 365 PJ per annum) development occurs.

Given the absence of reliable data regarding the shale resource, the development scenarios make an assumption that the quantity of any onshore unconventional gas is not a constraint, rather, any constraint on the size of any potential development is on the demand side and is contingent on the development of a quantity of gas that can meet certain price points in the market.

In addition to the uncertainty regarding the scale of commercial quality shale gas reserves, ACIL Allen was confronted with a significant challenge in developing a set of underlying assumptions that would allow it to model onshore unconventional gas industry in the NT. Typically, economic modelling is conducted using a project or industry-level financial model. However, the nascent stage of development of a shale gas industry in the NT means that this information was limited and largely held in commercial confidence by potential industry participants.

The scope variation meant ACIL Allen’s assessment was based on a perspective on what an industry ‘could’ look like, rather than an expectation of what it ‘would’ look like. It is also important to note that the change in the modelled scenarios meant that the results are ‘location agnostic’ insofar as they do not relate to development in a particular area; for example, the Beetaloo Sub-basin.
13.3.3 Information challenge

Typically, economic impact assessment modelling has a sound understanding of key variables such as the:

- total commercial gas reserve;
- daily/monthly/yearly production estimates;
- capital and operating expenditure required to produce gas;
- pipeline and other supporting infrastructure requirements;
- overall gas unit costs; and
- sales plan.

Given the very early stage of any onshore shale gas industry in the NT, this information was not available to support the modelling.

To conduct the economic impact assessment modelling, ACIL Allen had to develop a commercial financial model of an onshore shale gas industry in the NT. This was built using a range of assumptions. It is important to note that the economic modelling undertaken by ACIL Allen does not represent an assessment of the commercial viability of an onshore unconventional gas industry development in the NT.\(^{59}\)

To articulate the potential economic impacts of an onshore unconventional gas industry in the NT, ACIL Allen consulted broadly to develop a set of conservative estimates of what a successful development might look like. This included considering:

- the views of the Government, industry, non-gas industry stakeholders, traditional Aboriginal owners, non-government organisations, including environmental groups, and other representative bodies;
- its own expertise in gas markets and economic modelling;
- the experience of shale gas industry development in analogous regions across the world, particularly in the Marcellus Basin shale gas play in Pennsylvania. Both the Marcellus Basin and the Beetaloo Sub-basin plays exhibit similar geological characteristics (that is, they are assumed to be a mostly dry gas play, have a similar shale formation, have a similar depth and have a similar geology); and
- the latest research, data and insights of shale gas industry economics, including using information from the Marcellus Basin, where more than 2,000 wells are drilled every year.

These estimates were presented to, the approved by, the Panel in July 2017 prior to modelling commencing.

13.3.4 Modelling process

Given the lack of information regarding any onshore shale gas industry for the NT, ACIL Allen conducted a cascading series of four modelling activities regarding gas markets, project development and project cash flow. Outputs from these modelling exercises were inputs to the economic impact assessments modelling.

13.3.4.1 Gas market modelling

After setting three scales of development with respect to gas production (Breeze, Wind and Gale), ACIL Allen conducted base-level gas market modelling, where volumes of gas were offered to the market at $0.25 incremental pricing, starting at $2/GJ. This modelled market took up a portion (or all) of the gas at that price based on market demand and how competitive the NT gas was. To determine final sales quantities and values, ACIL Allen calculated the revenue maximising sales mix per annum (quantity and price), and adopted this as the target rate of sales for the industry.

13.3.4.2 Project development modelling

Project development modelling was undertaken to understand the production and infrastructure requirements to meet the volume of gas to be placed in the market, using a bespoke shale well production schedule model.

\(^{59}\) ACIL Allen 2017, p IX
The model required two major inputs: first, an assumed single average type curve of a hypothetical shale well (different for each scenario); and second, a series of assumptions regarding the infrastructure required to enable production to occur (wells, pads, gathering pipes, roads, water, camps and labour). This occurred in two streams and involved ACIL Allen creating two hypothetical companies to produce and transport shale gas under the four development scenarios. These hypothetical companies are:

- **ProjectCo**: which explores, appraises and develops the shale gas industry in the NT; and
- **PipelineCo**: which builds, owns and operates new pipeline infrastructure required to facilitate the sale of ProjectCo shale gas to market.

ProjectCo and PipelineCo are separate entities but interact through tariffs paid by ProjectCo to PipelineCo for the provision of pipelines to transport gas to market.

Key project development assumptions in the modelling are:

- **timing**: the development scenario modelling assumes the moratorium is lifted by the end of 2017–18, exploration and appraisal is undertaken in the period to 2019–20, development commences in 2020–21, and production begins in 2021–22;
- **gas quantity**: the volume of gas in situ is not a constraint, but the size of the market is;
- **dry gas**: all gas is 100% ‘dry gas’, with no higher value hydrocarbons, such as butane, ethane, propane or crude oil, targeted or available for extraction. A ‘liquids rich’ shale gas play results in a small increase in operating costs and a potential large increase in production revenue. The net effect of a liquids rich development is to significantly improve project economics. While gas companies are of the view there is likely to be a liquids rich shale in the Beetaloo Sub-basin, it is too early to estimate the types or quantities of liquids available for extraction. Given this uncertainty, ACIL Allen did not model any liquids; and
- **a single, average type curve**: which represents how much gas is produced from a single well at any point in time. ACIL Allen developed a single, average type curve based on advice from potential shale gas operators, information from similar fields in the USA and the Government. A typical shale gas type curve is a hyperbolic decline function, where the production of a well in the first period (typically reported in months) is very high relative to the average monthly production over the life of the well. A well’s production declines rapidly from this initial production rate and continues to produce for a long period of time at very low levels.

ACIL Allen built an average type curve for production wells under each development scenario, where gas production occurs based on assumptions regarding:

- **initial production rate**: the volume of gas produced in the first month of the well’s life;
- **decline rate**: the speed in which the well’s production declines per month;
- **estimated ultimate recovery**: the ultimate volume of gas that will be extracted from the well over its useful life; and
- **well life**: the useful production life of each well.

The parameters of ACIL Allen’s development type curve assumptions are reported in Table 13.1.

**Table 13.1**: ACIL Allen type curve assumptions. Source: ACIL Allen.60

60 ACIL Allen 2017, p 38.
This information was then used to estimate, for each development scenario where gas production occurs, a drilling schedule of how many wells would need to be built and when. The drilling scenario informed the need for well pads, roads, pipelines, labour and worker camps. The cost estimates to deliver infrastructure requirements were based on ACIL Allen's research and stakeholder feedback (see Chapters 5 and 6 of ACIL Allen's report at Appendix 17). Key elements of the project development include:

- to facilitate development and send gas to market, additional transmission pipeline infrastructure must be built. PipelineCo must build, own and operate all pipeline infrastructure for industry development;
- explicit development costs are included for wells/pads (drilling, roads, gathering pipelines and work camps);
- there are assumed ‘learnings’ where ProjectCo is able to reduce its cost per drilling operation over time (and therefore, cost per GJ of gas extracted) through repetition and incremental improvement;
- labour inputs by activity;
- pipeline specification and tariffs; and
- debt-to-equity ratio and debt terms, payments to Aboriginal landholders and pastoralists, government charges, local content and key macroeconomic variables.

Many stakeholders in ACIL Allen’s consultations identified that water consumption associated with hydraulic fracturing could have negative economic and social impacts in the NT. ACIL Allen has used water consumption assumptions that are considered an upper limit of water used for hydraulic fracturing activities. In doing so, ACIL Allen has assumed that there is no water recycling in its industry development scenarios, whereas gas companies in submissions to the Panel have assumed a recycling factor of 30-50% of water used for fracture stimulation. The Government does not currently charge for the extraction of groundwater undertaken by any industry, including mining and onshore energy companies. In line with the Inquiry’s requirement to conduct the economic modelling on the basis of current policy ACIL Allen assumed the only cost associated with water was a notional extraction cost borne by ProjectCo to access groundwater (but see the Panel’s discussion and recommendations in relation to charging for water extraction in Chapter 7).

### 13.3.4.3 Project cash flow modelling

ACIL Allen developed a cash flow model to estimate financial flows. The modelling suggests that:

- under the **Breeze scenario**, there will be an initial rate of 33.4 TJ/day ramping up to 90 TJ/day in 2034 (and less than the 100 TJ/day target);
- under the **Wind scenario**, the maximum amount of gas that is sold is 315 TJ/day (less than the 400 TJ/day target). The majority of the gas is sold into the east coast market, and this requires the development of additional gas pipeline infrastructure; and
- under the **Gale scenario**, the volume of gas and economies of scale in production mean NT gas is more competitive in east coast markets and as a feedstock for the production of liquefied natural gas, with production reaching 1,000 TJ/day by 2034.

The results of the financial modelling formed the basis for inputs to the economic impact assessment modelling.

### 13.3.4.4 Economic impact assessment modelling

Summary inputs and outputs of the ProjectCo and PipelineCo cash flow modelling were converted to a national accounting framework and processed through ACIL Allen’s *TasmanGlobal* computable general equilibrium (CGE) model.\(^{61}\) The four development scenarios were compared to the Baseline assessment of the future growth of the NT economy, to produce estimates of the potential economic impacts of each development scenario.

\(^{61}\) CGE economic models use economic data to estimate how an economy might respond to changes in policy, technology, or other external factors. CGE models are dynamic, and use elasticities to model how the response to an economic shock might change over time.
13.4 Economic impact assessment results

ACIL Allen used its in-house TasmanGlobal CGE model to model economic impacts of the development of any onshore shale gas industry in the NT. In line with the scope of works, modelling outputs are presented for three regions: the NT, the Rest of Australia, and Australia. (which is the combined sum of the NT and the Rest of Australia). This was undertaken for the following macroeconomic variables:

- **real income**: which is a measure of the income that is available for consumption or saving after adjusting for inflation. It is a measure of economic welfare. Real income accrues to the owners (and taxers) of land, labour and capital. As such, if capital is sourced from interstate or overseas, real income growth attributable to this capital is reported as accruing to the source of that capital (that is, interstate or overseas) and not reported as real income growth in the NT. Similarly, for taxation, revenue will be allocated to the jurisdiction that receives the revenue;

- **real output**: which is a measure of value adding that occurs in the geographic area of an economy (for example, the NT or Australia) after accounting for changes in the prices of goods and services produced, and essentially comprises salaries paid to employees and profits accruing to businesses. Real output is often referred to as ‘the economy’, ‘Gross State Product (GSP)’ for the NT or ‘Gross Domestic Product (GDP)’ for Australia. Unlike real income, where the added value is attributed to the source of the input (for example, capital or labour), real output captures the added value that occurs in the region, irrespective of the source of the inputs;

- **real final demand**: which is a measure of the value of goods and services consumed in an economy, irrespective of where those goods and services are produced;

- **real employment**: which is full time equivalent employment. An FTE of 1.0 is equivalent to a full time worker, while an FTE of 0.5 signals half a full workload;

- **real population**: which is the resident population; and

- **real taxation**: which is taxation accruing, separately, to the NT and Commonwealth.

The economic impact assessment was run under five scenarios: the Baseline scenario and the four development scenarios which represent deviations from the Baseline scenario. Table 13.2 reports key metrics for the Calm, Breeze, Wind and Gale development scenarios.

</table>
The economic impact assessment modelling suggests that there will be limited impact on sectors outside of any onshore shale gas industry and its supply chain. Significantly, the relatively modest labour requirement of any onshore shale gas industry means there is limited crowding out in the NT labour market as industries compete for the same labour.62

In addition, any onshore shale gas industry is likely to disturb a small surface area relative to the size of the NT (estimated 67 km² for Breeze, 232 km² for Wind, and 476 km² for Gale) compared with the NT’s total land area of 1,421,000 km². This means that the impact of any onshore shale gas industry on other key NT industries is likely to be minimal in terms of land use. This does not suggest land use impacts will be non-existent, rather it implies that, depending on the type of existing use, there may be scope to readily mitigate impacts.

### 13.4.1 Baseline scenario

In the Baseline scenario, the hydraulic fracturing moratorium remains in place, and the key driver of the NT economy is the ongoing impact of the Ichthys LNG project. There are also assumptions made regarding a number of additional projects on the NT’s horizon (for a discussion of the results of the Baseline scenario, see Chapter 7 of ACIL Allen’s report at Appendix 17). The scenario largely results in key macroeconomic variables for the NT returning to long-run averages.

Following the ramp-up of the Ichthys LNG project, ACIL Allen forecasts that there will be a period of slightly above average growth through the 2020s as the Territory’s aquaculture and horticulture industries grow faster than the rest of the economy and the Government’s 10 Year Infrastructure Plan is carried out. The impact on NT real output of any new offshore gas development to backfill Darwin LNG63 will be limited because the majority of infrastructure construction and supplies and services for an offshore development will be imported.

ACIL Allen’s Baseline modelling projects that the NT’s real output (the value-adding that occurs in the NT reported as the accumulated value of wages and profits to produce goods and services in the economy) will grow by an average of 2.9% per annum over the 25-year modelled period (2018–43). Growth in real output is forecast at 8% in 2019 as the Ichthys LNG production exports lift. Beyond this initial spike, the NT economy is expected to grow by 2.9% per annum on average through the end of the next decade, before the annual average growth rate weakens to 2.5% per annum.

---

63 Construction of the Darwin LNG plant commenced in June 2003, with the plant being officially commissioned in January 2006. Gas is sent by a 502 km pipeline from the Bayu-Undan field to the plant at Wickham Point, where it is converted into LNG for sale to Tokyo Gas and JERA (a joint venture between Tokyo Electric and Chubu Electric) in Japan. The facility has the capacity to process 3.7 million tonnes of LNG per annum.
annum to the end of the study period. Employment growth averages 1% per annum over the 25-year modelled period. It falls in the short term as the construction phase of the Ichthys LNG project nears completion.

Beyond the 2020s, ACIL Allen projects that the NT economy will grow in line with population, labour force participation and productivity growth. Real output is projected to grow from a $23.4 billion economy in 2018 to a $47.9 billion in 2043.

### 13.4.2 Calm scenario

In the Calm scenario, it is assumed the moratorium has been lifted, but ProjectCo does not proceed to development as a commercial-quality shale gas resource is not found. ProjectCo undertakes a three-year exploration and appraisal program, but fails to progress to production.

The Calm scenario is also the basis for the first four years of the development scenarios where gas production occurs (Breeze, Wind and Gale), but instead of the assumption that no commercial-quality shale gas reserve is discovered, it is assumed that commercial resources are discovered.

Under the Calm scenario, real final demand (the value of goods and services consumed in the NT) is estimated to increase by $539 million over the 25-year modelled period, with all of this occurring in the four-year appraisal period. Real output (the value-adding that occurs in the NT, which is essentially the value of wages and profits in the economy) is estimated to increase by only $4.1 million because the vast majority of inputs in this early stage are assumed to be imported to the NT. Real income impacts are minimal at only $20 million over the 25-year modelled period. The NT also collects an additional $12.2 million in taxation revenue, and the Commonwealth collects an additional $41.1 million in taxation revenue over the 25-year modelled period, with all of this occurring in the period to 2021. The activity generated by the Calm scenario results in a requirement for additional labour resources equal to an average of some 30 FTEs per year for direct and indirect employment above the baseline and over the four year Calm scenario.

### 13.4.3 Breeze scenario

In the Breeze scenario, it is assumed that the moratorium on hydraulic fracturing is lifted and that exploration and appraisal occurs in the period from 2018 to 2021, and that shale gas production commences in 2021–22. At the end of 2020–21, the facilities required to link to the Amadeus Gas Pipeline have been built and linked to the east coast market by the Northern Gas Pipeline (NGP). Gas is produced at an initial rate of 33.4 TJ/day in 2022, increasing to 90 TJ/day in 2034.

In this scenario, the development of an onshore unconventional gas industry has an impact on real income, which is a measure of economic welfare (or purchasing capacity), in both the NT and, most notably, in the rest of Australia. The real income impact of any onshore shale gas industry is largely accrued through the profits generated by the industry once it is operational, which also determines the level of profits-based taxation paid by that industry. Overall, the majority of the real income impact of the development under the Breeze scenario is transferred from the NT to the rest of Australia. This is in the form of Commonwealth taxes (income tax, company tax and royalties), and because the equity ownership of the industry is assumed to be largely on the east coast of Australia (that is, because it is assumed the capital investment to develop the industry is largely sourced from the rest of Australia, modelled real income returns associated with this investment are allocated back to the rest of Australia).

The real income impact in Australia is estimated to be $3.34 billion over the 25-year modelled period at an average of $126.1 million per annum. In the NT, the real income impact is estimated to be $937 million over the 25-year modelled period at an average of $36 million per annum. Real income impacts in the NT are realised through increased employment and a redistribution of additional taxation payments to the Commonwealth being distributed back to the Government. Modelled royalty and payroll tax payments made to the Government, and payments made to pastoralists and Aboriginal landholders also contribute to the real income impact in the NT.

Under the Breeze scenario, real final demand in the NT is estimated to increase by $3.3 billion over the 25-year modelled period (at an average of $126.1 million per annum), with real output estimated to increase by $5.1 billion (at an average of $196.5 million per annum over the 25-year modelled period). Real output is expected to increase over the modelled period consistent with increases in the level of production.
The activity generated by the Breeze scenario results in a requirement for additional labour resources equal to an average of 82 FTEs (2,145 job years)\textsuperscript{64} for direct and indirect employment in a given year over the baseline. While modest overall, this employment increase for the Breeze scenario represents the capital intensive nature of the shale gas industry.

Over the modelled period, the NT collects an additional $757 million in real tax revenue (at an average of $29.1 million per annum over the 25-year modelled period), which includes $309.2 million in additional royalties, and the Commonwealth collects an additional $1.31 billion in tax receipts.

Information on the modelled impact of the Breeze scenario on a range of economic variables is reported in Table 13.2.

\subsection*{13.4.4 Wind scenario}

In the Wind scenario, the target production rate increases to 400 TJ/day, with the majority of gas being placed into the east coast market, and requiring additional pipeline infrastructure to be developed as the capacity of the existing NGP is reached. The following investment into transmission gas pipelines is assumed to occur:

- tie in to the Amadeus pipeline;
- Amadeus duplication;
- NGP duplication; and
- Carpentaria Gas Pipeline duplication.

The real final demand impact in the NT under the Wind scenario is largely accrued through the investment needed to fund an onshore shale gas industry’s capital requirements and the additional investment needed for transmission gas pipelines. For the rest of Australia, the impact largely results from the household consumption impacts that accrue from rising real incomes resulting from the development, as well as further investment in transmission gas pipelines in eastern Australia.

Similar to the Breeze scenario, the Wind scenario has an impact on real income, in both the NT and the rest of Australia. The real income impact in Australia is estimated to be $9.12 billion over the 25-year modelled period at an average of $350.8 million per annum. In the NT, the real income impact is estimated to be $2.82 billion over the 25-year modelled period at an average of $108.4 million per annum.

Under the Wind scenario, real final demand in the NT is estimated to increase by $8.85 billion over the 25-year modelled period (at an average of $340.4 million per annum), with real output estimated to increase by $12.13 billion (at an average of $466.4 million per annum over the 25-year period). Real output growth largely changes in line with initial investment and then ongoing production patterns.

The activity generated by the Wind scenario results in a requirement for additional labour resources equal to an average of 252 FTEs (6,559 job years) for direct and indirect employment in a given year over the baseline. While modest overall, this employment increase for the Wind scenario represents the capital intensive nature of the shale gas industry.

Over the 25-year modelled period, the Government collects an additional $2.09 billion in real taxation revenue (at an average of $80.6 million per annum), which includes $894.6 million in additional royalties, and the Commonwealth collects an additional $4.58 billion in tax receipts.

Information on the modelled impact of the Wind scenario on a range of economic variables is reported in Table 13.2.

\subsection*{13.4.5 Gale scenario}

In the Gale scenario, it is assumed that the onshore shale gas industry has the volume of reserves and competitive production to enable it to progressively replace the offshore Bayu-Undan field as the gas feedstock for Darwin LNG, allowing Darwin LNG to continue to produce LNG at current

\footnote{A ‘job year’ represents the number of hours of work to facilitate the projection of economic growth. A ‘job year’ is not the same as an FTE job, the latter of which is a physical position and implied permanency, whereas the former is a calculation of labour effect. For example, ACIL Allen’s modeling indicates that in order to produce $100 million additional GDP over 10 years, the economy will require an extra 100,000 hours of labour across all sectors of the economy.}
volumes beyond 2022–23. This necessitates investment to expand the Amadeus Gas Pipeline to allow more gas to flow north to Darwin LNG.

For the economic modelling, it is assumed that Darwin LNG will continue to produce LNG at its current rate with or without gas from any onshore shale gas industry. In the Baseline scenario where the hydraulic fracturing moratorium stays in place, it is assumed that a new offshore development occurs and this gas backfills Darwin LNG. This is a critical assumption because it means that there is no incremental value associated with LNG production attributable to an onshore shale gas industry. The incremental value is the change to the production profile, profitability, and local content of gas required to backfill Darwin LNG in an onshore scenario compared to an offshore scenario.

It is also assumed in the Gale scenario that due to increasing economies of scale in production, falling costs allow for increased gas sales into the east coast gas market, potentially including partial backfill of an LNG train at Gladstone. The effect of large scale onshore shale gas production also results in a reduction in the wholesale price of gas in the east coast market, with the ‘ripple’ effect of the injection of more gas flowing west to east leading to less gas produced in Queensland fields moving south. Similar to Darwin LNG, there is no incremental value associated with LNG backfill. This necessitates further investment in the NGP and Carpentaria Gas Pipeline over and above the investment assumed to be required to meet Wind scenario east coast exports. As a result, the industry is able to fulfil its full target production of 1,000 TJ/day by 2035.

The Gale scenario has an impact on real income in both the NT and the rest of Australia. The real income impact in Australia is estimated to be $12.51 billion over the 25-year modelled period, at an average of $481.1 million per annum. In the NT the real income impact is estimated to be $5.78 billion over the 25-year modelled period, at an average of $222.2 million per annum.

Under the Gale scenario, real final demand in the NT is estimated to increase by $16.12 billion over the 25-year modelled period (at an average of $622.1 million per annum), with real output estimated to increase by $17.53 billion (at an average of $674.4 million per annum over the 25-year period). Real output is expected to increase over the 25-year modelled period consistent with increases in production, until 2036 when there is a transfer between onshore and offshore gas for Darwin LNG feedstock.

The activity generated by the Gale scenario results in a requirement for additional labour resources equal to an average of 524 FTEs (13,611 job years) for direct and indirect employment in a given year over the baseline. While modest overall, this employment increase for the Gale scenario represents the capital-intensive nature of the shale gas industry.

Over the 25-years modelled period, the Government collects an additional $3.72 billion in real taxation revenue (at an average of $143.2 million per annum), which includes $1.79 billion in additional royalties. The Commonwealth collects an additional $1.75 billion in tax receipts.

Information on the modelled impact of the Gale scenario on a range of economic variables is reported in Table 13.2.

13.4.6 Policy scenario probability matrix

ACIL Allen’s modelling and development scenarios (Breeze, Wind and Gale) were developed with gas production targets with a varying range of 36PJ per annum (Breeze), 150PJ per annum (Wind) and 365PJ per annum (Gale). ACIL Allen created a Policy Scenario Probability Matrix (Matrix), which outlined the likelihood of each development scenario being able to produce the target amount of PJ per annum, based on the known current resource of shale reservoirs in the NT. It has been well documented by ACIL Allen and the Panel that the infancy of the shale gas industry, and the limited amount of knowledge of the shale gas basins and the gas reserves contained in those basins, means that the modelling conducted by ACIL Allen is subject to more than usual uncertainty. This is demonstrated in the Matrix at Table 13.3 where under a full lift of the moratorium, there is a ‘high’ probability that the Breeze scenario will result in 36PJ of gas production occurring per annum. By comparison, a full lift of the moratorium has been evaluated as a ‘low’ probability that the Gale scenario will result in 365PJ of gas production occurring per annum. This ‘low’ probability is the result of the existing known shale resource data

65 The Net Present Value for each of the financial parameters (including Real Income, Output and Final Demand) are given in Tables 8.1 (Calm), 9.1 (Breeze), 10.1 (Wind) and 11.1 (Gale) of Appendix 17.
gained through exploration. Increased exploration and more accurate knowledge of the shale gas basins will either increase the likelihood of that development scenario producing 365PJ of gas per annum or it will remain a ‘low’ probability. ACIL Allen has stated that the Matrix is not an assessment of the commercial prospect of any shale gas industry in the NT. It was not requested to assess this.67

13.5 Comparison with Deloitte report

The only other relevant research investigating the impact of an onshore shale gas industry developing in the NT is the 2015 Deloitte report, *Economic impact of shale and tight gas development in the NT*, commissioned by APPEA.68

The Deloitte research examined two potential growth scenarios based on the supply of shale and tight natural gas to the NT, east coast, and export markets between 2020 and 2040. Both the ACIL Allen and Deloitte analyses used in-house CGE models, but they varied quite significantly in terms of the assumptions used in the modelling exercise and the subsequent modelled outputs. A comparison of the assumptions and modelled outputs is contained in Table 13.4 below.

---

Lock the Gate has suggested that the 2015 Deloitte modelling used a set of overly optimistic assumptions about how an onshore shale gas industry might develop in the NT, particularly with respect to demand and employment and cost.70 The Panel agrees.

There are a number of critical differences between the Deloitte and ACIL Allen assumptions. Deloitte uses lower capital and operational costs, meaning that more gas can be produced competitively under its development scenarios. Additionally, and significantly, the Deloitte modelling included the construction and commissioning of additional LNG facilities in the NT, with capital costs and production making a significant contribution to growth in reported variables, such as real output and employment.

In the Panel’s opinion, the ACIL Allen assumptions and modelling represent a much more realistic approach to estimating the economic impacts of any onshore shale gas industry in the NT.

69 ACIL Allen 2017, p 138
70 Lock the Gate submission 171, p 50.
13.6 Policy implications

ACIL Allen was required to describe the options available to the Government, whether through policy, regulatory reform, or other mechanisms, to maximise and sustain the benefits to Territorians if the moratorium is lifted and onshore shale gas development commences. This included:

- undertaking a literature review of leading practice and options;
- providing relevant case studies where options have been implemented and an assessment of lessons learnt;
- describing options for how revenue from development can be retained in the regions affected by any onshore shale gas development, without impeding investment; and
- considering local procurement requirements, local training programs and other mechanisms to improve local capacity, as well as any ‘Royalty for Regions’, or similar programs, including case studies, examples, and lessons learnt relevant to the NT.

ACIL Allen identified three key issues that policy makers must consider: how to maximise the capture of benefits; how to distribute the benefits; and how to manage and minimise any downside risks.

For a small and narrow economy like the NT’s, with a limited pool of excess and skilled labour, major projects (that is, projects of national or international scale) can have significant disruptive impacts on the economy, and society more broadly (see Chapter 12 for more detail). The objective for policy makers is to maximise the benefits while minimising the risks and ensuring that there is a high degree of certainty for all stakeholders.

ACIL Allen identified the main risks for the Government as:

- managing an increase in Government revenue;
- managing increased demand for labour;
- maximising local expenditure and opportunities;
- managing potential industry coexistence issues;
- addressing potential infrastructure constraints; and
- having appropriate industry regulation.

ACIL Allen’s assessment of these risks and the potential policy options to address them are discussed below.

13.6.1 Increased Government revenue

Additional taxation revenue will flow to the Government if the moratorium is lifted, both directly through increased royalty and payroll tax payments and indirectly through additional GST revenue distributed back to the NT. The Commonwealth collects GST, all of which is re-distributed to the jurisdictions, with the proportion each jurisdiction receives determined by the Australian Treasurer based on recommendations from the Grants Commission.

Additional revenue accruing to the NT Government over the 25-year modelled period under each of the development scenarios where gas production occurs is $757 million (at an average of $29.1 million per annum) in the Breeze scenario, $2.09 billion (at an average of $80.6 million per annum) in the Wind scenario and $3.72 billion (at an average of $143.2 million per annum) in the Gale scenario. In the Gale scenario, this equates to a sizeable increase to the NT’s recurrent revenue base of 2.2%, or more than 8% if Commonwealth Grants are excluded.

ACIL Allen’s modelling also outlines potentially strong growth in Commonwealth revenue over the 25-year modelled period. This increase is despite the likely cascading impact of reduced gas prices from the development of an onshore shale gas industry reducing the income earned by that industry outside of the NT. The increase in Commonwealth revenue where gas production occurs is $1.3 billion (at an average of $50.2 million per annum) in the Breeze scenario, $4.6 billion (at an average of $176.2 million per annum) in the Wind scenario and $5.5 billion (at an average of $210.4 million per annum) in the Gale scenario.

After collecting the additional revenue, the Government must decide how it will be used. This is primarily a distribution issue, with both geographic and intergenerational dimensions. While the pressure to spend any increased revenue is likely to be strong, there are also options for the Government to manage the additional revenue for the purposes of intergenerational equity.

71 ACIL Allen 2017, p 135.
ACIL Allen’s research suggests there is a case for windfall royalty revenue to be treated differently to general government income. This is because the Government is selling the right to mine a non-renewable resource, which is a one-off transaction. In this respect, mining royalties are different to taxes on income or consumption, which have perennial tax bases. Revenue raised from royalties should therefore be used to compensate society for the realisation of the value. This can be done by investing in the physical or human capital of the economy, to improve its productivity, or by warehousing the revenue in a special fund. ACIL Allen identifies two ways to do this; namely, a sovereign wealth fund, and/or a stabilisation fund.

Traditionally, wealth funds are used to accumulate revenue associated with windfall gains or with the extraction of non-renewable resources. The WA Government developed a sovereign wealth fund, the Western Australian Future Fund, in its 2012–13 Budget as a way of warehousing some of the proceeds of the iron ore royalty boom. The Fund received an initial capital injection of $1 billion between 2012–13 and 2015–16, and receives ongoing injections equal to 1% of the State’s royalty revenue per annum.

While well-intentioned, the broader settings of the WA Government’s finances are, however, not ideal to host a wealth fund given its significant public debt and high operating and cash deficits. This means the WA Government is effectively borrowing money to store in the fund. It is important to consider the state of public finances when making such significant, long-range decisions.

There are also a number of examples of countries that use a sovereign wealth fund for the purposes of stabilising government finances. These kinds of funds tend to be short-to medium-term in focus, and are used as a ‘banking’ mechanism for countries with volatile, uncertain revenue bases. These funds tend to have strict rules concerning when money may be deposited and withdrawn. The objective of smoothing out fluctuations in government revenue is to avoid large deficits or increased spending of short-term increases in revenue.

Notwithstanding the potential value of wealth and stabilisation funds, several submissions to the Panel suggested an infrastructure deficit in the NT (this is supported by Government analysis, notably, with respect to transport infrastructure and public housing), and it is likely that worthwhile projects, with long-term, intergenerational benefits streams could readily be found to utilise any additional revenue that the Government receives as a result of development of any onshore shale gas industry.

This raises the issue of the distribution of benefits across the NT from additional tax revenue. There are several options to distribute benefits across regions, with one recent example being WA’s ‘Royalties for Regions’ program. This program has the objective of promoting and facilitating economic, business and social development in regional WA. It has been in place since 2008–09. The program quarantines 25% of royalty revenue (up to an annual amount of $1 billion) for spending on regional development projects, town beautification and social programs. Since December 2008 the program has invested over $6.9 billion into more than 3,700 projects to improve infrastructure and services across regional WA. Since 2008-09, there have also been a series of changes to the program to improve transparency, decision-making, and accountability, and to shift its focus to job-creating projects rather than delivering community amenity projects and, importantly, to introduce an expenditure cap with annual reviews of the cap.

But WA’s independent Economic Regulation Authority (ERA) has noted that the quarantining of substantial revenue for regional projects reduces budget flexibility and inhibits proper capital prioritisation. The ERA further states that:

>“Hypothecation of royalty income is not an ideal way to demonstrate the Government’s commitment to regional development. Hypothecation results in an arbitrary annual allocation of total expenditure, rather than considering economic conditions, affordability, competing government priorities, or the quality of projects under consideration. It would be a coincidence if the amount allocated to regional projects under the program reflected the optimum level of expenditure.”

76 WA Department of Primary Industries and Regional Development 2017.
77 Economic Regulation Authority Western Australia 2014, p 66.
78 Economic Regulation Authority Western Australia 2014, p 82.
The ERA also notes that the quarantining of royalties at a time when significant royalty revenue was having a negative impact on WA’s GST allocation resulted in the proportion of the budget available for regional expenditure being higher than anticipated, and that the subsequent lack of budget flexibility contributed to Standard & Poor’s downgrade of the WA’s credit rating.

Others have suggested that the Royalties for Regions program provides substantial infrastructure and service projects to regional communities, but have questioned the program’s governance arrangements and the capacity to assess whether it is achieving its objectives. Based on the development scenarios modelled by ACIL Allen it is unlikely that revenue streams associated with the development of any onshore shale gas industry in the NT will be of a scale to warrant the development of a specialist fund for the purposes of fiscal stabilisation or intergenerational equity. Additionally, the literature suggests that there is no clear evidence of broader societal benefits to the NT from implementing policies to retain a proportion of royalty revenues in the regions where resource extraction occurs. However, ACIL Allen’s analysis has noted that, based on its consultations, it is worth considering the benefits and costs of implementing such policy options given the significance to regional populations of ensuring that at least some of the additional taxation revenue is used to benefit residents in affected areas.

**Recommendation 13.1**

*That in developing its budget, the Government must have regard to the source of royalty revenue and must ensure that regions that are the source of taxation revenue benefit from any onshore shale gas extraction activity that has occurred in their region.*

*That the Government works with local government, stakeholders, Land Councils, and local communities in the design and implementation of all such programs.*

### 13.6.2 Managing an increased demand for labour

The development of any onshore shale gas industry in the NT has the potential for substantial labour benefits in the form of job creation, skills development, and workforce diversification. An increase in the demand for labour due to the development of the industry can be measured by the direct labour that is hired to work on the construction and operation phases of the development, as well as the indirect employment impact from the jobs generated by additional spending in the economy.

ACIL Allen estimates that the direct and indirect employment impact of the industry will be an average 82 FTE (Breeze), 252 FTE (Wind), and 524 FTE (Gale) per annum, with much of this employment likely to occur in regional areas where development activities will occur. It is through the salaries and wages associated with employment that regional communities are likely to see real benefits from the creation of an onshore shale gas industry, with increases in real income and living standards.

Any emergence of an onshore shale gas industry in the NT should create economic development opportunities in regional areas that will be in close proximity to Aboriginal communities, or in regions with large Aboriginal populations. Private sector employment opportunities in these regions tend to be scarce, and relatively low rates of employment is one of the factors contributing to poor economic and social outcomes experienced by Aboriginal people. Research demonstrates that increasing Aboriginal employment rates will result in extensive economic, health and social gains to Aboriginal people and communities. The challenge for policy makers is to devise a strategy for improving employment as efficiently as possible, and that minimises expenditure in the form of labour market assistance for people who would have found a job in any event.

The extent to which employment opportunities are realised will depend on the skill sets of local job seekers and the availability of training to gain the required skills. There has been a strong commitment by local companies to develop local skills for any onshore shale gas industry. For example, MS Contracting is an NT company that has developed skill sets of local people in and around the Beetaloo Sub-basin. MS Contracting, which has previously been awarded contracts by Pangaea, has established the Flying Fox Station - Centre of Excellence. This facility provides...
for persons to experience “live-in, real life training” with 32-person accommodation, workshops, equipment and machinery operations and training for Certificate III in Civil Construction.91 Consultation with local Aboriginal communities identified a preference to maximise the use of local job seekers to assist in keeping development benefits on country. The NLC also noted that many Aboriginal communities are remote and largely reliant on welfare, and that a mature and well-designed onshore shale gas industry offers the potential to address a number of the economic pressures placed on people living under these conditions, including through direct employment and training opportunities related to the exploration and production of onshore shale gas.82 Pangaea has previously worked in partnership with the NLC and MS Contracting to develop and deliver a program of industry-specific training targeted to the local traditional Aboriginal owners. It provided participants with the minimum entry level skills for employment within the Pangaea tenements.83 Pangaea, Origin and Santos have all previously invested in training and development with local communities in the NT, and have cited their intention to increase this activity if the moratorium is lifted.84 All three companies have cited employment outcomes in other States as evidence of their ability to maximise local benefits and increase participation for local people and businesses.

Nonetheless, given the remote locations of the potential development sites in the NT, it is expected that there will be an unavoidable need in the short to medium-term for a significant proportion of the workforce (with the required technical skills) to be employed on a FIFO or DIDO basis. It is during this short-to medium-term demand that the NT labour market can respond through developing education and training opportunities that will create in people skills that are applicable to the onshore shale gas industry. Over time, it is expected that the local employment content of the industry will increase as the skills and experience of the local workforce grows.

Having said this, recent research in the UK context reports that,

> “the expansion of the shale gas industry will not automatically deliver significant economic benefits to the local economies in which it operates, unless supply chains are embedded more firmly within the region and a higher proportion of the workforce is drawn from the local community.”85

This suggests that there is a strong incentive for the Government to work with gas companies, local residents, Aboriginal people and local businesses to identify, as early as possible in the development process, opportunities to partner and develop the skills and processes necessary to be part of the supply chain for goods, services and labour.

There will be opportunities for the Government to maximise the workforce benefits of any onshore shale gas development and to ensure that these benefits are able to be accessed by all job seekers in the NT. There is a critical role for the Government in coordinating the requirements of any onshore shale gas industry with employment and training providers and local businesses. This includes identifying the timing of any development and the skills required for the exploration, construction and production phases of the industry. It is also important to work with employment agencies and training providers to ensure that they match their services to the needs of any onshore shale gas industry. This will assist in maximising local employment benefits and promoting the distribution of those labour benefits to job seekers throughout the Territory.

There will also be advantages in setting local Aboriginal and non-Aboriginal employment targets. Programs that aim to facilitate the flow of information between employers, trainers and job seekers will be important tools in ensuring positive local employment outcomes for the NT workforce.

Recommendation 13.2

That the Government works with stakeholders and gas companies to ensure that there is early knowledge of the labour and skills required for all phases of any onshore shale gas development in order to maximise local employment.

Recommendation 13.3

That the Government works with gas companies, training providers, local workers, job seekers, Land Councils and local Aboriginal corporations and communities to maximise opportunities for local people to obtain employment during all phases of any onshore shale gas development.

Recommendation 13.4

That the Government ensures that training providers and gas companies collaborate so that skill requirements are clearly understood by training providers, and that trainees acquire appropriate skills.

Recommendation 13.5

That the Government works with gas companies, training providers, Land Councils, local government, and local communities in the setting of local employment targets, including local employment targets for Aboriginal people.

Maximising local expenditure and opportunities

Local content policy is founded on the principle of full, fair and reasonable opportunity for local businesses to secure work on large public and private sector projects. The development of any onshore shale gas industry in the NT offers opportunities for local businesses through an expected higher local spend. A recent example of local content is the Aboriginal-owned and Elliott-based Triple P Contracting, which has been awarded a $200,000 per annum well monitoring contract with Origin requiring it to expand its workforce by two FTE.86

There is always the risk of a mismatch between the expectations of gas companies and the capabilities and services of local suppliers, which results in local businesses missing out on business opportunities. There is a vital role for the Government to play in ensuring that there is an information flow from gas companies regarding available local business opportunities. There is also a cognate role for the Government to work with local businesses to ensure that they properly communicate their capabilities and availability to industry. Encouragingly, many resource companies are realising that hiring and sourcing locally is a key element in building positive, long-term relationships with communities and regions, providing business benefits through cost reductions and efficiency improvements and earning and maintaining an SLO.

From a corporate perspective, local economic participation is seen as one means of maintaining an SLO, by giving communities a stake in the project, as well as having the advantage of having a supplier located nearby. From a community perspective, the participation of local businesses in a resource project is a means by which the benefits of resource development can flow into communities. The benefits of supply chain participation have become particularly apparent in Aboriginal communities where there are agreements to enable greater Aboriginal economic participation and to support the development of Aboriginal owned enterprises.87

The desire to increase local content is not restricted to gas companies. Increasing local procurement is supported by the Government in order to promote private sector led development and improved living standards by strengthening the small to medium enterprise sector. The Government has a number of initiatives in place to capture the benefits from any onshore shale gas development, including the Building Northern Territory Industry Participation Policy, a procurement program requiring local content, and a partnership with the Industry Capability Network Northern Territory (ICN-NT), to ensure that the Government’s commitment to local participation is met.88

There will also be benefits in setting local content targets for gas companies and contractors to maximise the capture of direct and indirect spending in the NT. There is further benefit in working

87 Esteves and Barclay 2011.
88 Department of Trade, Business and Innovation 2011.
with gas companies to promote the services of local businesses, particularly those in regional and remote areas insofar as it assists in distributing the benefits of development to businesses located throughout the Territory. The Panel received several submissions from gas companies and local businesses recognising the importance of local business participation, which includes establishing hard local procurement and employment targets integrated with community business. Addressing information asymmetries by identifying the timing of development, and the goods and services required for the construction and operation phases of development, is an important role for the Government in maximising local content opportunities.

**Recommendation 13.6**

*That the Government works with gas companies and local suppliers to ensure that there is early knowledge of local supply and service opportunities for all phases of any onshore shale gas development.*

**Recommendation 13.7**

*That the Government works with gas companies and local suppliers (regional and Territory wide) to identify immediate supply opportunities and to facilitate future potential supply opportunities. This should be done in consultation with the ICN-NT and the Chamber of Commerce.*

**Recommendation 13.8**

*That the Government works with gas companies, Land Councils, local Aboriginal corporations, Aboriginal communities, and businesses to identify local supply and service opportunities to keep sustainable economic benefits on country.*

**Recommendation 13.9**

*That the Government assists regional businesses to obtain quality assurance certification and to partner with larger suppliers to encourage greater local supply, employment and knowledge transfer.*

**Recommendation 13.10**

*That the Government works with gas companies, Land Councils, local governments, local suppliers and businesses to devise and implement local procurement targets.*

### 13.6.4 Managing potential industry coexistence issues

The issue of industry coexistence and the ability of an onshore shale gas industry to integrate with the existing industry structures of the NT was raised by most stakeholders consulted by ACIL Allen and with the Panel during community consultations. Of concern is the extent to which any onshore shale gas industry may impede or distort the allocation of the economic factors of production, particularly natural resources such as land and water. The clearing of native vegetation will be required for well pad construction, roads and other linear infrastructure (see Chapter 8). The amount of cleared land depends on the size of development required.

ACIL Allen has accounted for the opportunity cost of this land by assuming that it is made unavailable for pastoralism, as areas like the Beetaloo Sub-basin are predominantly beneath pastoral lease. Under the assumptions regarding water use, the industry may use between 4.2 GL (Breeze), 11.2 GL (Wind), and 28.2 GL (Gale) of water, respectively, over the 25-year modelled period. This represents average consumption of 0.17 GL (Breeze), 0.45 GL (Wind) and 1.13 GL (Gale) per annum under each scenario. This is significantly less than the Australian Bureau of Statistics’ estimate of agricultural water use in the NT; namely, 47 GL in 2015–16.

In stakeholder consultations, ACIL Allen received information to suggest there are a range of options available to any onshore shale gas industry to source water, both potable and...
non-potable, in a manner that minimises tensions with existing users. Water is unlikely to be an economic constraint on the development of any onshore shale gas industry, and the prospect of a reduction in water availability for the non-shale gas industry users in the aggregate is limited. In an economic sense, this means there is unlikely to be a material opportunity cost from the use of water by any onshore shale gas development.

It is therefore unlikely that any onshore shale gas industry will impede the existing allocation of natural factors of production in the NT in an economic sense. However, it is important for the Government to remain aware of the activities of gas companies and to carefully monitor the industry’s use of the NT’s natural resources. This should primarily occur through regulation, in relation to which the Panel has made recommendations in Chapter 7 regarding water licensing, a charge for water extraction, and WAPs.

**Recommendation 13.11**

*That the Government works with gas companies, peak bodies of affected industries, and affected stakeholders to identify and resolve all potentially negative economic impacts of any onshore shale gas development on other industries.*

**13.6.5 Addressing potential infrastructure constraints**

The development of any onshore shale gas industry in the NT will place additional pressure on existing and planned infrastructure, including economic, social and civic infrastructure. There will be an increased demand for road, rail and port infrastructure to transport goods and personnel to and from any onshore shale gas development sites. There may also be additional pressure on social infrastructure such as health, education and civic services, particularly in regional areas where infrastructure often has limited capacity to respond to rapid increases in demand.

Development of infrastructure by, and for, any onshore shale gas industry will have social and economic benefits for the NT, particularly for regional areas where much of the infrastructure development is likely to occur. Some of this infrastructure development will be undertaken by industry, but there is also an essential role for the Government to invest in economic infrastructure to encourage growth. The Government’s infrastructure priorities are detailed in the [Northern Territory 10-Year Infrastructure Plan](#), and a regular review of the Plan will allow industry-related projects to emerge as priorities as they come closer to commencement. The current Infrastructure Plan includes projects to progressively upgrade the Stuart, Carpentaria, Buntine and Tablelands Highways, which could support the development of any onshore shale gas industry and minimise impacts on existing users.

The Australian Government has also committed in the May 2017 Budget to fund a pre-feasibility study and cost-benefit analysis of a potential gas pipeline linking the NT to Moomba in SA. The Australian Government’s $5 billion Northern Australia Infrastructure Facility (NAIF) is another potential source of support for project-specific infrastructure, as well as infrastructure that can support multiple users or produce benefits to the broader economy and community. A key objective of the NAIF is to support infrastructure development, recognising that infrastructure is a fundamental driver of economic change that can stimulate productivity and economic and employment growth, especially in remote areas, by encouraging private sector investment and increasing accessibility to markets.

ACIL Allen’s consultation found that there were perceived issues with some infrastructure that would support the development of any onshore shale gas industry, for example, the capacity of the Stuart and Carpentaria Highways to support increased development-related traffic volumes. Similar to the challenges presented by managing gas industry coexistence, a key issue is finding public policy positions that create certainty for all stakeholders and that encourage development, while also balancing efficient resource use and societal concerns.

92 NT Government 10 year Infrastructure Plan.
93 Australian Government 2017c, p 93.
94 Northern Australia Infrastructure Facility Investment Mandate Direction 2016, made under the Northern Australia Infrastructure Facility Act 2016 (Cth).
Recommendation 13.12

*That the Government works with all levels of government, (including the Australian Government), peak organisations, communities and gas companies to identify and manage infrastructure risks, including identifying and implementing options to fund any new infrastructure or upgrade existing infrastructure.*

**13.6.6 Appropriate industry regulation**

Petroleum extraction is subject to significant regulatory requirements that reflect its heightened safety risks and potential adverse environmental impacts. During ACIL Allen’s stakeholder consultation, gas companies unsurprisingly did not express dissatisfaction with the current regulatory regime for petroleum extraction in the NT.

The Fraser Institute’s *Global Petroleum Survey 2015* found that the NT was rated as the third most development-favourable jurisdiction in Australia from a regulatory perspective and the 34th most favourable of the 126 jurisdictions surveyed by the Institute. This is not necessarily a good thing from an environmental perspective.

The most substantive issue regarding gas industry regulation was a perception the Government is not fully equipped to regulate any onshore shale gas industry. This was an issue that private sector, government and non-government organisation stakeholders raised with ACIL Allen and the Panel. Regulatory enforcement is critical to facilitating an SLO. The significant land mass of the Territory and the remote location of prospective shale gas developments, makes regulation of the industry challenging.

ACIL Allen noted that the level of funding for petroleum regulation in the NT is low compared to other jurisdictions in Australia. The level of funding is not necessarily a measure of the level of service delivery, but the difference between the NT and other jurisdictions suggests that this is an issue to be examined further, especially as the compliance and enforcement capacity of the regulator is a significant concern of the community. Given the current financial challenges, there is a need for the Government to examine innovative approaches to regulation, including the consideration of a levy on onshore shale gas companies to greater fund regulatory activities.

Leading-practice principles suggest industry should ‘pay its way’ when it comes to regulation. This is because appropriate regulations and enforcement is critical to the industry earning an SLO. Gas companies are also the major beneficiary of a regulatory regime that enables the safe development of the industry. There is scope to increase current fees and charges for any potential onshore shale gas industry (which are low at present) to fund any uplift in expenditure required to more adequately resource government regulators. This is discussed further in Chapter 14.

**13.7 Conclusion**

ACIL Allen’s economic impact assessment modelling reports that lifting the moratorium on hydraulic fracturing in the NT may deliver (depending on the outcomes of reservoir exploration and gas production activities) tangible economic benefits in the form of increased income, output, employment and taxation revenue, and an increase in the NT’s population. The extent of economic benefit increases with the volume of onshore shale gas that is extracted and commercially produced.

However, the Panel believes that the potential negative impacts on other industries must be considered, together with the policy options to mitigate those impacts, while identifying and capturing opportunities to maximise benefits that can accrue to local and regional communities (and the NT more broadly) from any onshore shale gas development.

It is acknowledged that any onshore shale gas industry development could put additional pressure on infrastructure, and identifying and funding options to alleviate this pressure must be examined. There are minimal coexistence risks as prospective onshore shale gas regions have significant groundwater reserves, and the land area used by the industry is very small under all development scenarios.

The Panel has considered ACIL Allen’s modelling and policy analysis and the issues raised in the submissions in developing its recommendations. The recommendations aim to balance the dual goals of maximising local benefits (locally, regionally and across the NT) of the development of any onshore shale gas industry, while not disrupting the efficient allocation of resources (such as capital and labour) that will be necessary to make the industry competitive.
The Panel’s principal recommendations identify the need for early and ongoing engagement between all stakeholders to identify risks and opportunities that may be associated with any onshore shale gas development. There is a clear and critical role for the Government to work with stakeholders to develop and implement pathways that aim to mitigate risks and resolve conflict. The Panel is also of the opinion that the Government must work with all stakeholders to maximise local benefits from industry development, including local employment opportunities, and opportunities for existing and new local businesses to supply goods and services to the industry. While not being prescriptive with respect to how the Government uses any additional revenue, the Panel recommends that in developing its budget, the Government considers the source of royalty revenue and ensures that source regions benefit through greater infrastructure and services expenditure.
