Some Bell GRoundwater is located in a series of distinct basins, with larger areas up to 25 km by 25 km and smaller areas up to 5 km by 5 km in size. Larger aquifer systems are often confined by surface features such as river valleys, structural basins, and dunes. The groundwater levels of the areas are generally not higher than 25 metres below grade. Piezometers, which are water-filled boreholes, have been installed in several areas to monitor groundwater levels. This information is used to support the development of water supply systems and their operation.

The groundwater level data in some areas suggests that groundwater levels are generally not higher than 25 metres below ground level. This information is used to support the development of water supply systems and their operation.
